In dimetienda quantitate dilatationis corporum a calorico ita in primis experimenta sua instituisse invenimus Physicos antiquiores, ut illam pro majore caloris differentia determinarent, plerumque supponentes, cuivis gradui Thermometri alicujus, temperaturam quandam intermedium indicantis, proportionalem esse dilatationem. Maximam scilicet, quam assequi possent, inaequalitatem temperaturarum in experimentis quæsiverrunt, ut expansiones majores invenient, atque ut errores, qui evitari nequirent, minimi escent momenti. Hinc accedit, ut adhuc paucorum corporum certe cognoscamus dilatationem pro quovis gradu caloris in Thermometro dato. Exceptis enim legibus expansionis aeris atmosphaericici aliarumque aeris specierum, vaporum aquæ puræ & spiritus vini °), nec non dilatationis vitri °), nullam in-

venimus in scriptis Physicorum formulam, cujus operationes aliorum corporum expansionem in data aliqua temperatura determinare possemus. Sic quoque ad determinandum volumen aquæ puræ in diversis temperaturis omni caremus regula certa, etiamsi cognitio hæc utilis omnino esset. Secundum observationes quidem D:ni NOLLET contendunt Physici, volumina aquæ conglaciantis & ebullientis esse in proportione 1 : 1,04^o); inde autem eo minus de gradu dilatationis in temperaturis aliis mediis concludere licet, quo certius ex recentiorum experimentis apparere videatur, expansionem aquæ pro gradibus puncto congelationis proprioribus minorem, pro gradibus vero propriebus ebullitionis punctum sitis majorem esse.

Qui præterea Thermometris aqueis experimenta de dilatatione aquæ instituerunt, nec non qui gravitatem aquæ specificam corpora solida in illa ponderando determinarunt, contendunt volumen aquæ circa temperaturam + 5° in Thermometro CELSII minimum esse, quibus tamen alii jure objecerunt, considerationem dilatationis instrumentorum suorum illos.

dilatatione a calorico, Präside G. G. HÄLLSTRÖM & Resp. PETRO CHRIST. SNELLMAN, edit. Aboe 1801, pag. 8 & 9.

* Vide: PRONY l. c. i Th. 280 f.

los neglexisse, adeoque nihil certi ex eorum experimentis concludi posse *).

Cum inventam habeamus regulam, cujus ope determinari queat pro data caloris temperatura vitri dilatatio **), cumque etiam computare possimus, quam effectum dilatatio hæc instrumentorum vitrorum in experimentis circa aquæ expansionem factis exserat ***); veram hujus expansionis legem, de qua in temperatura congelationis calori propiore præcipue inter Physicos disputatur, jam inveniri posse contendimus, & quidem nostra de determinanda dilatatione intra puncta 0° & $+20^{\circ}$ in Thermometro centesimali conamina paginis sequentibus venia lectoris candidi publici juris facimus.

Satis quidem fuisset commodum, experimenta in hac disquisitione necessaria instituere cum aqua in-

elusa in tubo, qui globo instructus esset; cum autem metueremus, ne evaporatio aquae, cuius mensuram facere non possemus, dimensiones altitudinis in tubo erroneas redderet, cumque etiam determinationem radiorum tubi & globi satis exactam, quae in calculo necessaria fuisset, instituere nequiremus; corpus vitreum in aqua ponderando hujus dilatationem in diversis temperaturis invenire conati sumus. Usi sumus bilance hydrostatica, a celebri Angliae mechanico HURTER affabre facta, cui pilo humano appendimus vitrum album, & hujus pondus in aere atque in aqua destillata exactissime, ut potuimus, observavimus. Differentia horum ponderum diminutionem ponderis in aqua nobis praebuit, quae in temperatura congelationis sit $= p$, in calore autem graduum m in Thermometro CELSI $= p'$. Si nulla vitri dilatatio fieret, volumen aquae, quod in temperatura 0° ponitur $= 1$, in calore m graduum esset $= \frac{p}{p'}$; facto autem vero aquae volumine $= y$ in hac temperatura, habetur $y = (1 + \frac{(325 + 2m - m)}{6250000})^3 \cdot \frac{p}{p'}$, qua aequatione, postquam inventum erat pondus vitri in aere $= 91718$, ad inveniendum valorem y in sequente Tabula usi sumus.

Gra-

*) Cfr. Dissert. nuperr. cit. p. 11,

Gradus Therm.	Pondus in aqua.	Dimin. ponder.	$p : p'$	γ	$\gamma - 1$

+	20	53247	38471	1,0005200	1,0008717

Ex hac tabula appareat, si nulla dilatationis vitri ratio habetur, in temperatura $+ 5^\circ$ & $+ 6^\circ$ maximam videri aquæ densitatem, sicut illam quoque alii diversis modis invenerunt. Si vero in aucta temperatura vitrum dilatatum consideratur, atque calculus observata hac expansione instituitur, propior quidem tem-

A 3 pera-

peraturæ congelationis invenitur calor ille, in quo aquæ densitas est maxima, non autem hoc in ipsa congelatione accedit, ut putare videntur D:ni VON ARNIM ^o) & MONGE ^{oo}). Nam circa quartum vel intra quartum & quintum caloris gradum minimum esse volumen aquæ apparet. Præterea notabilem in hisce experimentis efficit mutationem dilatatio vitri. Non enim parva, adeoque nec negligenda, est differentia inter $\frac{P}{P'}$ & y , quæ etiam in majore calore major est.

Ut appareat lex expansionis aquæ in diversis temperaturis, assumamus æquationem, quæ pro dato aliquo caloris gradu x dabit dilatationem $y - 1$ voluminis ejus, esse hanc: $y - 1 = Ma^x + N\beta^x + \gamma'$, in qua quantitates constantes $M, N, \alpha, \beta, \gamma'$, ope quantitatum in tabula præcedente datarum determinabuntur. Brevitatis causa ponamus

gradibus Thermometri $x = 0; 5; 10; 15; 20;$
respondere valores $y - 1 = 0; a; b; c; d;$
ut,

^o) Vid. *Annalen der Physik*, herausgegeben von LUDW. WILH. GILBERT, Halle 1800, 5 B. 1 St. 65 f.

^{oo}) Cfr. *Neue Architektura hydraulica*, von PRONY, 1 Th. 280 f.

ut, substitutis his successively in æquatione generali,
habeantur sequentes æquationes:

$$\begin{aligned}o &= M + N + \gamma', \\a &= M\alpha^s + N\beta^s + \gamma', \\b &= M\alpha^{10} + N\beta^{10} + \gamma', \\c &= M\alpha^{1s} + N\beta^{1s} + \gamma', \\d &= M\alpha^{20} + N\beta^{20} + \gamma'.\end{aligned}$$

Subtrahendo quamcunque harum posteriorem a
priore exterminatur γ' , & inveniuntur sequentes:

$$\begin{aligned}-a &= M(\mathbf{1} - \alpha^s) + N(\mathbf{1} - \beta^s) \\a - b &= M\alpha^s(\mathbf{1} - \alpha^s) + N\beta^s(\mathbf{1} - \beta^s) \\b - c &= M\alpha^{10}(\mathbf{1} - \alpha^s) + N\beta^{10}(\mathbf{1} - \beta^s) \\c - d &= M\alpha^{1s}(\mathbf{1} - \alpha^s) + N\beta^{1s}(\mathbf{1} - \beta^s)\end{aligned}$$

Si ulterius ab antecedentibus, in α^s ductis sub-
trahuntur sequentes, eruuntur

$$\begin{aligned}-a\alpha^s - a + b &= N(\alpha^s - \beta^s)(\mathbf{1} - \beta^s); \\(a - b)\alpha^s - b + c &= N\beta^s(\alpha^s - \beta^s)(\mathbf{1} - \beta^s); \\(b - c)\alpha^s - c + d &= N\beta^{10}(\alpha^s - \beta^s)(\mathbf{1} - \beta^s).\end{aligned}$$

Harum æquationum membra posteriora efficiunt
seriem geometricam, cuius exponens est β^s , quare
membra priora has dant æquationes:

$$\begin{aligned}(-a\alpha^s - a + b)\beta^s &= (a - b)\alpha^s - b + c; \\((a - b)\alpha^s - b + c)\beta^s &= (b - c)\alpha^s - c + d;\end{aligned}$$

unde

unde exterminando β^5 eruitur

$$\frac{(a-b)\alpha^5 - b + c}{-\alpha\alpha^5 - a + b} = \frac{(b-c)\alpha^5 - c + d}{(a-b)\alpha^5 - b + c},$$

& evolutis terminis atque positis

$$(a-b)^2 + a(b-c) = A, (a-b)(b-c) + a(c-d) = B,$$

$$\& (b-c)^2 - (a-b)(c-d) = C, \text{ erit}$$

$$A\alpha^{10} - B\alpha^5 + C = 0.$$

Hujus vero æquationis radicem quadratam quærendo invenitur

$$\alpha^5 = \frac{B + \sqrt{B^2 - 4AC}}{2A}; \text{ adeoque}$$

$$\alpha = \left(\frac{B + \sqrt{B^2 - 4AC}}{2A} \right)^{1:5}.$$

Inventa sic α , determinatur β^5 ope æquationis

$$\beta^5 = \frac{(a-b)\alpha^5 - b + c}{-\alpha\alpha^5 - a + b} = \frac{B - \sqrt{B^2 - 4AC}}{2A};$$

unde innotescunt

$$\beta = \left(\frac{(a-b)\alpha^5 - b + c}{-\alpha\alpha^5 - a + b} \right)^{1:5} = \left(\frac{B - \sqrt{B^2 - 4AC}}{2A} \right)^{1:5};$$

$$N = \frac{-\alpha\alpha^5 - a + b}{(\alpha^5 - \beta^5)(1 - \beta^5)};$$

$M =$

$$M = \frac{a - N(1 - \beta^s)}{1 - \alpha^s} = \frac{a\beta^s + a - b}{(\alpha^s - \beta^s)(1 - \alpha^s)}$$

$\& \gamma' = -M - N.$

Si jam substituuntur valores experimentis inventi, scilicet

$$a = 0,0002818; \quad b = -0,0000685;$$

$$c = 0,0003330; \quad d = 0,0008717;$$

inveniuntur

$$M = 0,001008357. \quad \text{Log. } M = 0,0036145 - 3.$$

$$N = 0,000715207. \quad \text{Log. } N = 0,8544320 - 4.$$

$$\alpha = 1,04835314. \quad \text{Log. } \alpha = 0,0205076.$$

$$\beta = 0,74566831. \quad \text{Log. } \beta = 0,8725456 - 1.$$

$$1 + \gamma' = \gamma = 0,9982765.$$

His itaque adhibitis valoribus habetur pro aquæ volumine y in temperatura x graduum, in Thermometro centesimali intra 0 & $+20^\circ$ observatorum, determinando hæc æquatio:

$$y = Ma^x + Nb^x + \gamma.$$

Ope hujus æquationis sequentem computavimus tabulam:

Gradus Therm.	Volumen a- quæ calculo inventum.	Differentia inter vo- lumina quæ expe- rimentis & calculo inveniuntur.
0	1,0000000	0,0000000
+	1,09998669	— 0,0000077
+	1,09997824	— 0,0000097
+	1,09997349	+ 0,0000012
+	1,09997156	— 0,0000034
+	1,09997182	0,0000000
+	1,09997381	— 0,0000056
+	1,09997715	+ 0,0000049
+	1,09998161	+ 0,0000049
+	1,09998698	— 0,0000078
+	1,09999314	0,0000000
+	1,09999995	+ 0,0000013
+	1,0000747	— 0,0000027
+	1,0001553	— 0,0000014
+	1,0002413	+ 0,0000037
+	1,0003328	+ 0,0000002
+	1,0004295	— 0,0000008
+	1,0005347	— 0,0000035
+	1,0006392	— 0,0000022
+	1,0007524	— 0,0000062
+	1,0008713	— 0,0000004

Optime itaque experimentis convenire videtur calculus ope æquationis $y = Ma^x + N\beta^x + \gamma$ institutus, & quidem exactissime, si quinque primas notas decimales consideraveris; parte enim voluminis censes

ties millesima minor obvenit differentia inter volumina, quæ experimentis & calculo inveniuntur.

Ut exacta inveniatur temperatura x , in qua volumen aquæ y minimum evadat, differentietur æquatio $y = M\alpha^x + N\beta^x + \gamma$, ut, denotante L Logarithmum hyperbolicum, habeatur $dy = M\alpha^x dx \cdot L\alpha + N\beta^x dx \cdot L\beta$, adeoque pro casu minimi y , $\frac{dy}{dx} = -M\alpha^x \cdot L\alpha + N\beta^x \cdot L\beta = 0$. Hinc erit $M\alpha^x L\alpha = -N\beta^x L\beta$, atque

$(\frac{\alpha}{\beta})^x = -\frac{NL\beta}{ML\alpha} = -\frac{Nl\beta}{Ml\alpha}$, denotante l Logarithmum vulgarem; adeoque invenitur

$$x(l\alpha - l\beta) = IN - IM + l(-l\beta) - l(l\alpha),$$

$$\text{et } x = \frac{IN - IM + l(-l\beta) - l(l\alpha)}{l\alpha - l\beta}.$$

Cumque sit $-l\beta$ quantitas positiva, ut etiam omnes reliquæ quantitates affirmativæ, erit quoque x realis. Est autem in casu præfenti

$$\begin{aligned}
 -I\beta &= 0,1274544, \text{ adeoque } I(-I\beta) = -0,8946452 \\
 I\alpha &= \underline{0,0205076} \quad -I(I\alpha) = \pm \underline{1,6880852} \\
 I\alpha - I\beta &= \underline{0,1479620} \quad + \underline{0,7934400} \\
 -IM &= \pm \underline{2,9953855} \\
 IN &= \pm \underline{3,7898255} \\
 &\quad + \underline{3,1455680} \\
 &\quad + \underline{0,6442575}
 \end{aligned}$$

$$I. 0,6442575 = 0,8090594 - 1.$$

$$I. 0,1479620 = \underline{0,1701443} - 1.$$

$$Ix = \underline{0,6389151}.$$

adeoque $x = \pm 4,35427;$

in qua temperatura minimum est aquæ volumen y .
 Ut vero hoc volumen innotescat, fiat valoris 4,35427
 substitutio pro x in æquatione $y = M\alpha^x + N\beta^x + y$,
 quo factò invenitur minimum volumen

$$y = 0,9997143.$$
