## Preface

Finnish Mass Media is the seventh volume in Statistics Finland's series of comprehensive statistical compendia on the mass media sector in Finland. Like all previous reports in the series, it is very much a product of cooperation: Statistics Finland has worked closely with the Ministry of Transport and Communications to produce reliable data on the development of mass communication since 1985. Since the early 1990s the Ministry of Education has also been actively involved.

Finnish Mass Media is a fully updated and revised edition of Joukkoviestimet 1998, in Finnish. In addition to the seven comprehensive statistical overviews on mass communication, several other reports have been published within this project on different aspects of the media field.

Finnish Mass Media was compiled and edited by Rauli Kohvakka and Tuomo Sauri (responsible editor), who also wrote the overview articles of the report. The Tables and Figures were compiled by Irma Ollila; the layout is by Seija Töyräänvuori; and the translation into English by David Kivinen.

The article on Finnish web publications is by Päivi Kuusisto, who is currently working for the City of Tampere as Internet information coordinator. Statistics Finland wishes to thank her for an interesting contribution.

Helsinki, April 1999

## Introduction: the changing mass media scene in Finland

Finland's per capita consumption of print media has long been one of the highest in the world. Although newspapers saw their circulation decline quite rapidly with the severe economic recession in the early 1990s, Finland still has one of the world's highest newspaper circulation and number of book titles relative to its population of 5.2 million. Finnish people are also quite avid readers whose reading habits have remained largely unaffected by the continuing expansion of the electronic media - at least for the time being. The strong position of the print media is also reflected in the turnover statistics for the mass media and the breakdown of advertising expenditure by different media categories: the print media still account for 70 per cent of the total.

On the other hand, the field of electronic media has seen many major structural changes during the past ten years or so, in spite of the economic recession. The first licences for local commercial radio stations were issued in 1985, and over the next few years new stations mushroomed all over the country. The television scene changed decisively with the 1993 channel reform which saw the separation of pub-lic-service (YLE TV1 \& TV2) and private broadcasting (MTV3 Finland) onto their own channels. From its early beginnings until 1993, the Finnish system had been quite exceptional with its undogmatic collaboration between public and private television services. The commercial operator MTV Finland had broadcast its programmes under the public service YLE's operating licence and rented air time slots on YLE's two channels, providing about one-fifth of the supply of TV1 and TV2, thus making the Finnish model truly "mixed".

In 1996 the government issued an operating licence for a fourth nationwide (commercial) channel. Channel Four Finland started programming in June 1997. One of the main challenges to the fourth channel will be to share with YLE and MTV the costs of setting up a terrestrial digital TV network.

There are now plans to set up in Finland three terrestrial digital television networks or multiplexes that will carry a dozen or so channels (including the current four nationwide channels) as well as a range of interactive services. Initially the launch of digital programming for the general public has been scheduled for the Olympic Games in the year 2000. The total costs of building the digital networks are estimated at around FIM 0.5 billion. Programme production costs are expected
to total some FIM 650 million a year, while the costs of interactive services during 1999-2002 will be around FIM 0.5 billion. Households will be spending an estimated FIM 2-3 billion in the necessary hardware; this figure is based on estimates of the costs of set-top boxes. The price of digital television receivers proper will obviously be much higher, even several times higher. The sums involved are quite considerable. For instance, in 1997 the turnover of nationwide television broadcasting was around FIM two billion, the value of sales of television sets was FIM 800 million. For the time being there remain many unanswered questions with regard to financing digitalization; with regard to some technical solutions; such as the standardization of set-top boxes; and with regard to the interest of consumers in the new channels and services and in purchasing the necessary hardware. Indeed the Government has been called upon to look into the move to digital television and radio so that its costs to consumers can be minimized.

In 1996 an operating licence was also granted to the first nationwide commercial radio channel alongside the four existing public-service channels. Radio Nova went on the air in 1997. From the very outset the new channel has represented serious competition for commercial local radio stations, many of which have been struggling financially ever since the onset of the recession.

## Economy

Statistics on the turnover of the Finnish mass media during the 1980s attested to a fairly impressive rate of growth: at current prices the increase in turnover was almost threefold, at constant prices 1.5 -fold. In recent years the sector as a whole has represented around three per cent of the country's GNP.

The electronic media have been growing faster than the competition: in ten years the print media have lost six percentage points of their market share to the electronic media. Nonetheless the print media (newspapers and magazines, books, printed advertising material) are still way ahead, representing 70 per cent of the sector's turnover.

With the onset of the deep recession in the early 1990s, the turnover of the mass media in Finland began to decline. The print media were more badly affected than the electronic media. The latter continued to increase their relative share of the mass media business.

Since 1994 the situation has improved considerably, both for the national economy as a whole and for the mass media. During the past couple of years the mass media industry has grown at a rate of around five per cent per annum. In 1997 its turnover stood at FIM 18.4 billion, or ECU 3.1 billion.

## The development of the print media

Finland is traditionally a land of newspapers. In 1998 a total of 220 newspaper titles were published in the country, 56 of these being dailies. Circulation and coverage statistics are still quite impressive, in spite of the impacts of the recession. However, as newspapers are heavily dependent on revenues from advertising, they were bound to be affected when companies decided to cut their advertising budgets. Even so newspapers still account for about 30 per cent of the turnover in the mass media sector, showing a decrease of no more than a couple of percentage points during the 1990s. This is not very much when considered against the dramatic changes in newspapers' main sources of revenue and circulation figures. Today just over half of newspapers' revenues come from the sale of advertising space, at the beginning of the 1990s the proportion was in excess of 70 per cent.

The total circulation of Finnish newspapers started to decline in the early 1990s, for the first time since World War II. Several newspapers have even been closed down altogether, and circulation figures have been dropping across the board. Between 1990 and 1998, the total circulation of newspapers declined by 18 per cent. However, the circulation of Finnish newspapers still ranks among the highest in the world. Calculated per 1,000 population, the circulation of Finnish dailies, for example, is third only to Norway and Japan.

In advertising terms, too, newspapers continue to dominate the Finnish media market, even though they have lost some 10 per cent of their share of the advertising cake during the 1990s. Newspapers still account for over 50 per cent of media advertising in Finland, while the average figure for the whole of Europe in 1996 was 40 per cent.

One trend that may be expected to continue is the formation of newspaper chains. As a result of company takeovers and mergers the market shares of the biggest newspaper houses (as measured in terms of circulation) have started to grow. For instance, the market share of the four biggest publishers has increased from 31 per cent in the mid-1980s to 48 per cent in 1998; the corresponding figures for the top eight companies are from 43 per cent to 61 per cent.

Both of the two biggest newspaper groups in Finland are major multimedia companies. In spring 1999 the country's biggest newspaper house Sanoma, the biggest book publisher WSOY and the second biggest magazine company Helsinki Media (which is also the biggest shareholder in Channel Four Finland) merged to form a company called Sanoma - WSOY. Sanoma - WSOY publishes Helsingin Sanomat, the biggest daily in Finland; Ilta-Sanomat, the biggest afternoon tabloid; and also a nationwide business newspaper in Helsinki. Also, since spring 1999, it is the sole owner of a major chain in regional and local newspapers in northeastern Finland. In spring 1999 Sanoma - WSOY accounted for an estimated $25 \%$ of the total newspaper circulation in Fnland. Alma Media publishes Aamulehti, a major
regional daily in Tampere; the business newspaper Kauppalehti; and the afternoon tabloid Iltalehti in Helsinki. In addition, Alma Media is the majority shareholder in or the sole proprietor of 19 other newspapers. In early 1999, after its most recent acquisitions, it accounted for around $17 \%$ of the total circulation of newspapers. Alma Media was created in spring 1998 through the merger of the major newspaper publisher Aamulehti Group and the leading commercial TV channel MTV3 Finland. Alma Media is also the biggest single shareholder in the country's only nationwide commercial radio channel, Radio Nova, which was launched in spring 1997.

There is a clear trend towards closer editorial cooperation both within newspaper chains and even between independent newspapers and newspaper houses. This sort of cooperation is bound to lead to a convergence in terms of newspaper contents, but as far as the individual consumer is concerned there is a definite plus side to the trend: it will probably mean greater diversity in the content of one's own newspaper.

Another significant development has been the rapid growth of tabloids. There are two national "afternoon" tabloids in the country, although both have now started to appear in the news-stands early in the morning. Their combined circulation of some 330000 copies has increased by some 80000 copies compared with the mid-1980s. One further noteworthy structural development is the decline of "second" newspapers, i.e. smaller papers in towns with at least two newspapers.

In terms of economic volume, magazines and periodicals represent the second biggest category in the Finnish mass media sector. Magazines and periodicals are dependent on advertising to a far lesser extent than newspapers. However, in recent years the share of magazine advertising has begun to grow, and the difference compared with the average Western European level has been reduced. Nonetheless in 1997 advertising in magazines and periodicals accounted for no more than 15 per cent of total media advertising, around four percentage points less than in European countries on average.

Finland is one of the few countries in Europe where the delivery of newspapers and periodicals is based primarily on subscriptions. It is estimated that almost 80 per cent of magazine and up to 90 per cent of newspaper sales are based on subscriptions and are delivered to the consumer's door.

The eight major publishers of magazines and periodicals account for some 80 per cent of the total volume of consumer magazines and for around 30 per cent of the total output in the periodical press (the total number of consumer magazines, business magazines, customer magazines and opinion journals published in Finland adds up to some 2,700 titles). Finland's three biggest magazine publishers are Yhtyneet Kuvalehdet, Helsinki Media Company and A-lehdet. Following ownership rearrangements in 1998, Yhtyneet Kuvalehdet is now a subsidiary of Otava, Finland's second-biggest book publisher. Helsinki Media Company is in turn part
of Sanoma - WSOY, whereas A-lehdet is an independent family-owned company which for the time being is involved in no other mass media sectors.

All three biggest publishers remain in domestic ownership. At the same time, however, a number of major Scandinavian publishers (Aller, Bonnier, ICA) have established a firm position in the marketplace. Despite the language barrier, cross-cultural exchange seems to be fairly fluent. On the other hand, some Finnish magazine publishers, perhaps most clearly the Helsinki Media Company and Yhtyneet Kuvalehdet, have been taking steps towards internationalization in various forms. In addition, many special-interest magazines have established forms of editorial cooperation with corresponding magazines published in other countries.

Book publishing has been the third biggest segment of the print media business in Finland. During the years of recession sales were severely affected by forced decisions in schools and libraries to cut back on acquisitions. Since the mid-1990s, however, book publishing has been doing reasonably well. Statistics on the number of book titles relative to population show that Finland has retained its position among the leading countries in the world; Iceland is way ahead of the rest of the field in this table, other high-ranking countries apart Finland include Denmark, Holland and Switzerland. In 1997 a total of almost 12000 book titles were published in Finland, twice as many as in the early 1980s. At least in the light of this evidence it seems that the growth of electronic communication has had no adverse impacts on book publishing. Most of the titles are published by companies and organizations whose main line of business is some other than book publishing (e.g. public administration, universities). However, publishing houses proper still account for the bulk of the volume of book sales.

As far as book publishing is concerned, the market is very much dominated by major and medium-sized general-interest publishers. In recent years, however, smaller publishers specializing in certain types of literature have clearly been increasing their market shares.

Finland has a very extensive network of public libraries and in spite of the financial difficulties experienced in the 1990s, they still provide a good service. The use of libraries has continually increased. In 1997 a total of just over 100 million lendings were made from public libraries, which translated into around 16 books and four other items (audio cassettes, videos) per capita. In the same year around 2.5 million people in Finland, roughly half of the population, used the services of public libraries. All in all libraries are a very significant channel of book distribution in Finland. In fact, the number of books borrowed per year currently exceeds the annual sales of members of The Finnish Book Publishers' Association more than three times over.

## Electronic media

Since the mid-1980s Finnish television broadcasting has seen many significant structural changes. The growth of cable television continued to accelerate towards the end of the decade, and satellite channels became increasingly accessible to large audiences. At the same time the number of households with VCRs increased rapidly.

Around the mid-1980s there were widespread fears that the continuing growth of satellite television and video could seriously undermine the "unified culture" represented by the mixed system of public service and commercial television in Finland - as well as its financial basis. As a consequence the Finnish Broadcasting Company YLE and MTV Finland intensified their cooperation and even joined forces to start up in 1987 a third, commercially financed television channel, Kolmostelevisio, which broadcast until the end of 1992.

Since the beginning of regular television broadcasting in Finland in 1957, the commercial television station MTV had to lease its broadcasting time from the public service broadcaster YLE on the latter's TV1 and TV2. There have also been various other links of dependency between the two companies: for instance, MTV has broadcast its programmes under YLE's operating licence (until autumn 1993). MTV has also been a major source of funding for YLE in addition to licence fees.

At the beginning of 1993 the public service operator YLE and the commercial MTV parted ways. Both were allocated their own channels: YLE1 and YLE2 are now reserved for public service broadcasting, while MTV3 Finland operates its own nationwide, full-service commercial network, with its own operating licence. But even today, a very substantial part of MTV3's revenues goes to YLE in the form of a network leasing fee and the so-called public service fee. (The payments accounted for 20 per cent of YLE's turnover and for over 40 per cent of MTV3's turnover in 1996.) The latter fee, renamed as an operating licence fee, was made statutory as from the beginning of 1999 and was extended to apply to all television (as from 1999) and radio broadcasting (as from 2004) over the air.

Following the channel reform, with no technical obstacles to contend with, there was no real excuse any more for declining to grant an operating licence to a fourth (commercial) television channel that would compete with MTV for advertising money. Therefore in 1996 the government granted an operating licence for a fourth nationwide channel: Channel Four Finland (Nelonen) started programming in June 1997. The operating licence was issued to a company of which Helsinki Media Company (Sanoma - WSOY) owns just over half. Other shareholders include a few domestic independent television production companies, a newspaper chain, and with a $25 \%$ ownership, Egmont, Denmark's biggest communications company. Egmont also owns one-third of the Norwegian commercial nationwide TV network TV2.

In 1998 Channel Four still accounted for no more than 7 per cent of total television viewing time; the corresponding figures for MTV, the market leader in commercial television, was 42 per cent, for YLE with its two channels 46 per cent.

In the late 1980s cable television networks were expanding at a rate of approximately 100000 new subscribers per annum. During the 1990s things have been moving much more slowly. Overall the role of cable and satellite channels has been much less significant than in the other Scandinavian countries. The primary reason has been the scarce supply of programming in the Finnish language. At the moment the supply is limited to a few pay-tv channels and one sports channel. In contrast to the other Scandinavian countries, Finland has not seen any full-service satellite channels dedicated to the local audience of this country. Cable networks have largely served as distribution networks for pan-European channels such as MTV Europe, Eurosport, and TV5.

Commercially financed local radio stations spread out across the country within the space of just a few years after the first licences were issued in the mid-1980s, and they quickly secured their (small) share of the advertising cake. However, the recession severely affected local radio stations.

Although a total of some 30 local radio stations closed down and merged with other stations during 1990-1998, new companies have sprung up in their place so that the total number of local radio stations has remained more or less unchanged. At the end of 1998 there were a total of 58 local radio stations in the country. In addition, the format radios Kiss FM (owned by SBS) and Classic FM (owned by GWR), both operating in several cities and, in spring 1997, Radio Nova, the first nationwide commercial radio channel, have entered the commercial radio market. The competition is fiercest in the Helsinki metropolitan region where there are now ten or so radio stations that are commercially financed.

The start-up of Radio Nova (in which Alma Media is the biggest single shareholder) has been a great success. At year-end 1997, i.e. after the first nine months on the air, its channel share in its primary target groups (the audience aged 25-44) was one-quarter of the listeners. The losses have been felt equally by YLE's public service radio channels and by local radio stations.

YLE has public service radio broadcasting on four nationwide channels plus extensive regional radio services. In addition, YLE has started digital radio broadcasting in autumn 1998. The programming for the digital talk radio channel Radio Peili ("Radio Mirror") is compiled from the programmes broadcast by YLE on its analogue nationwide channels. For the time being the channel also broadcasts in analogue format in parts of southern Finland.

Television's share of the advertising cake remained small until the end of the 1980s. However, during the recession its share began to grow very rapidly, while the print media were to suffer most from the effects of the recession. In recent years, however, the share of television has remained steadily at 21 per cent of media ad-
vertising. This is a fairly small market share compared with the Western European average ( 30 per cent in 1996). The share of commercial local radio stations in media advertising has been on the decline in the 1990s. During the past few years it has remained at 3.5 per cent.

Online information services, most of which are business-to-business information services, showed rapid growth during the late 1980s, and the trend continued until the mid-1990s. In recent years, however, this growth has slowed down. As far as services intended for consumers are concerned, the demand for fee-based online services is still marginal, and at least for the time being it seems very difficult for operators to collect money for these kinds of services. As for Internet advertising, in 1998 it accounted for less than half a per cent of total media advertising.

## Recorded media

Phonograms and videos have long accounted for around 6-7 per cent of the mass media sector, but it seems that their share has now started to grow. The phonogram markets have grown quite rapidly during the past couple of years. However, a major new threat to this growth is represented by pirating, which is a booming business just across the border in the Baltic and St. Petersburg regions. Not only top-selling international artists but also domestic performers have now become victims of the pirating business.

In 1997 the five major multinational labels BMG, EMI, Polygram, Sony, and Warner together accounted for just under 60 per cent of total phonogram sales in Finland.

The video markets are divided into two segments, i.e. video rentals and sell-through. The market shares of these two segments have virtually been turned upside down during the 1990s. At the beginning of the decade sell-through videos accounted for less than one-quarter of the total markets, during the past couple of years their share has been slightly below 70 per cent. In the past couple of years the turnover of video rentals has also shown some growth after several years of stagnation and decline. The rental market has obviously benefited from the lowered price levels: it is estimated that within the past few years the average rental prices have dropped by around one-quarter.

Most videos are of American origin; domestic products account for only a small proportion of the rental and sell-through markets. The market is dominated by four distributors: Finnkino (owned by a subsidiary of Sanoma - WSOY), Buena Vista, Egmont Entertainment and Warner Home Entertainment. Together, these four account for almost 90 per cent of the video markets.

However, time-shifting or the viewing of programmes recorded from television is far more common than viewing sell-through or rental videos. In 1998,
three-quarters of total video viewing time was spent on viewing programmes recorded from television.

In 1997 CD-ROMs still accounted for no more than FIM 200 million or about one per cent of the turnover of the mass media in Finland. During the past couple of years market growth has been somewhat slower than expected. As far as CD-ROM games are concerned this is often explained by the revival of playstations as well as by pirating. As regards multimedia CD-ROMs, it seems that growth is hampered by two major factors, i.e. pirating and free and ready access to high-quality encyclopaedic material on the Internet.

In the 1980s and early 1990s the film industry in Finland suffered serious setbacks as other mass media continued to grow and expand. In the 1980s, the main challenge came from video and television. In this situation of stiffening competition, the number of cinema admissions steadily declined. At the same time the number of cinemas declined sharply as theatres with one and two screens were closed down and multiscreen cinemas were opened. The number of films shown also dropped very clearly, although there has been no real change in the annual number of premieres. In 1995 Finns went to the cinema no more than approximately once a year per person, but during the past couple of years it seems that the trend has been reversed. In 1998 the number of cinema admissions was 1.5 per capita. The biggest cinema chains in the country have recently started renovation projects aimed at raising the quality standards of cinemas, and it is believed that the new huge multiplex theatres with their sophisticated technology and additional services will provide another major boost to cinema-going.

## Finnish web publications

Finland has the world's highest per capita density of Internet connections. Web publishing is also at a high level, with a large number of small media companies involved in spite of the fact that the business is still running at a loss. Advertisers are not willing to spend their money on other than the biggest pages, and readers are not willing to pay for web publications. Most Internet publications are therefore compiled on limited budgets using existing materials published by a news agency or in the company's own newspaper or radio or television programme. It is still quite rarely that one finds fresh articles on the net specifically produced for this medium.

This chapter provides some background information on the use of computers and the Internet in Finland; reviews some of the most popular web addresses and Internet publications; and briefly describes the pages of Finnish organizations and associations in mass communication.

## Home computers for work and study

Consumer surveys show that Finnish people generally buy computers for purposes of work and study (Turpeinen 1998, 52). The main reason for taking out an Internet subscription is that people want to keep up with what is happening around them and to make their life easier by using e-mail and online banking services (ibid., 53). People who have experience of the Internet mainly use it for purposes of searching information ( $87 \%$ ) and for e-mail ( $70 \%$ ). Other items indicated from the preset list included retrieving data files ( $65 \%$ ), occasional surfing ( $60 \%$ ), following news events ( $60 \%$ ) and entertainment (magazines, music, etc.; 47\%) (Rissa \& Järvinen 1997). User surveys conducted by web papers have shown that Finnish readers are mainly interested in local news, advertisements and events calendars (Ilkas 1997, 9).

Since the end of 1995 Finland has had the world's highest per capita number of host computers connected to the Internet. In July 1998, the number of hosts per 1000 population was over 100 ; in practice this means one host connected to the Internet per ten persons. The second highest figure in the world (excepting some non-independent islands) was recorded for Iceland (77), the United States (73, estimate), and Norway ( 72 hosts per 1000 population) (c.f. http://www.tieke.fi/tietopal/tilasto/nwhpa.htm).

In Finland the costs of an Internet subscription have recently fallen quite sharply. Operators usually charge a connection fee and a monthly fee, which is nowadays usually fixed and not dependent on the amount of time spent on the Internet. On top of this the user obviously has to pay for the local phonecall. Setup costs are in the region of FIM 150, the fixed monthly fee is around FIM 50. The cost of a local phone call after business hours in Helsinki, for example, is $47 \mathrm{p} /$ call and after half an hour $5.5 \mathrm{p} /$ minute. This means that users who spend one hour a day on the Internet pay around FIM 115 per month.

Nearly 40 per cent of Finnish households have a home computer and around one fifth have an internet connection (see figure 1 in chapter 10 of this publication). In October-November 1998, over one fourth of the population aged 15-74 (1 087000 ) used the Internet at least once a week at home, at their place of study or in the workplace, while some $15 \%$ (504000) said they used the Internet on a daily basis. The Internet is now used more often at home than in the workplace or place of study. The number of home users has nearly doubled within the space of one year (Figure 1). On the other hand, computers are increasingly used outside the home. The combined weekly number of people accessing the Internet at their place of study or in the workplace was 839000 , the weekly number of home users was 536000 .

Figure 1. Changes in the place of Internet use from October-November 1997 to October-November 1998

In the home, computer use is not evenly divided among all family members. The most active users today appear to be young men in small households as well as children and young people in family households. (Nurmela 1998, 97.) Home computer ownership is highest among 30 -year-old men who live alone, among couples of the same age and in families with children who are at school or studying. More than half of boys aged 10-14 use the home computer on a daily basis, among men aged 15-29 two-fifths are daily users. Adult women who have a family use computers less often than women in households with one or two people. (Ibid., 90.)

Young men in the age group 20-30 are the most frequent users of information networks (ibid., 91). Computer use in the workplace significantly reduces the gender inequality that characterizes home use: women have access to a computer in the workplace more often than men, though on the other hand the computer skills they learn at work tend to be rather limited and do not necessarily inspire independent use and surfing on the net (ibid., 95).

## Popular Finnish web publications

A total of some 170 journalistic web publications are published regularly in Finland (see table 7 in chapter 10 of this publication). These include both publications of large media houses and smaller alternative publications. Almost all large media companies have their own web pages.

The research agency Taloustutkimus measured the popularity of more than 50 Finnish homepages by asking respondents which WWW services they had visited at least sometimes. The most popular producer of web contents was the commercially financed television channel MTV3, whose Internet pages had been visited by half of all the respondents. The top ten list of most popular services includes, among others, search engines and homepages of service providers (Table 1).

As well as measuring how well people know different homepages, Taloustutkimus carries out regular Web Traffic Monitor measurements to rate the popularity of almost 40 Finnish services. Half of the pages monitored contain journalistic material. The reports published include average weekly figures for page impressions, visits and different visitors. (Table 2)

In addition to publications intended for the general public, there are also various online news services on the web designed specifically for companies. One of the biggest services is run by the news agency Startel (http://www.startel.fi), which specializes in real-time economic news. It operates a fee-based EXPR database, which includes financial news from 1991 onwards. The Finnish News Agency (STT), Alma Media Interactive and Talentum News Desk are among the providers of general online news services.

Table 1. The most popular web pages in alphabetical order (Autumn 1998)

| Name of service | Description |
| :---: | :---: |
| Altavista (Finnish) | Search engine |
| Eemeli | Search for Finnish e-mail addresses. |
| Ihmemaan Haku | Search from Finnish servers, Yellow Pages and atlas. Short news bulletins from Finland and abroad, weather reports. |
| IItalehti | News stories from the printed afternoon tabloid. |
| IIta-Sanomat | Some news stories from the printed afternoon tabloid |
| iNET Keskuskatu (Sonera) | Web pages of Internet service provider, including short news bulletins, search from Finnish pages and list of links. |
| Keltainen Pörssi | Electronic version of a classified advertisements paper. Fee charged for browsing latest issues. |
| Kolumbus (Finnet Group) | Web pages of Internet service provider; including links to the news of Italehti, MTV3, Kauppalehti (business news) and Tietokonelehti (computer magazine). |

## Web publishing by major media companies

Web publishing in Finland is dominated by the country's two biggest media companies, Sanoma - WSOY and Alma Media, the latter of which is partly in Swedish ownership. Sanoma - WSOY publishes Helsingin Sanomat, whose weekday circulation in 1998 was 473000 . Helsingin Sanomat has published a web supplement (Verkkolite) since 1996, but access is restricted to subscribers of the daily paper version. The supplement contains much of the same news material that is published in the paper version, but pieces are also written specially for the web version. Once a month the supplement includes a special package (Klik!) which makes extensive use of visual and audio material as well as of interactivity. For example, in the September 1998 supplement 'Deadline' predicted users' life-expectancy and probable date of death on the basis of the information they entered on their age, sex, and details concerning smoking and drinking habits, etc. The supplement features a word search from archives, which include all the material published in the supplement since May 1996. In addition to the current issues covered, Verkkoliite offers some services (such as a guide for people moving into Helsinki) that are accessible to all Internet users. The same applies to classified advertisements on houses, cars and job vacancies, which can also be searched.

The web pages of the commercial television channel MTV3, which is owned by Alma Media, advertise themselves as the most popular web address in Finland. The pages include news material which is updated round-the-clock, and news stories produced by MTV3 are featured complete with video and audioclips from news broadcasts. Visitors can also access MTV3's Internet archives using word or date searches. The archives go back to June 1996. There are games and hobby packages (motorcars, boating, formula, horseback riding), which include stories as well as for-sale and wanted columns. MTV3's basic pages can be accessed without registering, but entry into the pages of the youth programme 'Jyrki' does require registration. These latter pages feature competitions and chat channels. The most popular chat channel for young people in Finland is KissFM, which features the homepages of the youth radio station chain owned by Scandinavian Broadcasting System and which also gives access to the station's broadcasts in RealAudio format.

The web pages of the provincial daily Aamulehti, which is owned by Alma Media, include not only daily news from the paper but also provide space for various communities and societies operating in Tampere (where Aamulehti is published). Among the organizations that have made use of this space are the town's ice hockey clubs and a volunteer organization providing social services for the frail elderly.

Alma Media's Kauppalehti Online concentrates on financial news and is provided for the main part on a fee basis. Online news, the news archives, and stock exchange notifications are accessible only to subscribers of the paper version, but all the services can be paid for separately. The web pages of Talousanomat (owned by

Sanoma - WSOY), the main rival of Kauppalehti which was launched in 1997, are (at least for the time being) free of charge. These pages include an English language news service 'News in brief'.

Alma Media's Iltalehti, the second biggest afternoon tabloid in Finland, publishes nearly all of its news material on the net, except for its weekend issue. The web pages of the biggest afternoon tabloid, Sanoma - WSOY Group's Ilta-Sanomat, do not as yet include any other material than short excerpts from its daily content.

The pages of the public-service broadcaster YLE introduce the company's television and radio programming, but also include news flashes and still pictures from television programmes. Excerpts from Swedish-language news also include video and audioclips. Teletext services are available in full on the Internet, in both Finnish and Swedish. It is also possible to listen to audioclips of radio news that have been broadcast earlier, excerpts from a few other radio programmes, as well as a news bulletin in Finnish, Swedish, English, German, French, and Russian. There is also a weekly current affairs bulletin in Latin (Nuntii Latini). Information on YLE and its audience is also available in English.

On the commercial side, Sanoma - WSOY and Alma Media have a serious competitor in Talentum, which publishes magazines in such fields as business, marketing and computers. Talentum has launched a net service intended specially for marketing, advertising and computer professionals (Duuni.net). A total of some 18000 registered users have subscribed. In addition to online news, the pages contain articles produced by the members of the community and some twenty active chat groups.

## English web pages of media organizations

On their web pages most Finnish media organizations and associations provide news and background on their own operation and on the media field in general not only in Finnish but also (at least in part) in English.

The web pages of the Finnish Periodical Publishers' Association contain basic information on Finnish periodicals in pdf format. The databases include information on the number of periodicals, their circulations and number of readers. There is also a list of FPPA's member publications' homepages. The pages of the Finnish Newspapers Association provide background information on the Association itself as well as lists of all newspapers published in the country. There is also a list of the Internet addresses of Finnish newspapers. Another exhaustive list of Finnish web papers and periodicals can be found on the pages of the Union of Journalists in Finland.

The web pages of the Association of Finnish Broadcasters, which is the interest organization of private radio stations in Finland, provide information on the past and present of commercial radio broadcasting in Finland. The pages also include a comprehensive list of the web pages and broadcasting frequencies of radio stations currently in operation.

The pages of the Finnish Film Foundation include up-to-date information on new and upcoming Finnish films, the biggest box-office hits, and on the operation of cinemas. There is also a short index of important figures in Finnish film. The Finnish Book Publishers' Association has on its pages a short historical survey of book publishing in Finland as well as key annual statistics. Cultnet's Booknet includes information on Finnish literature and lists of bookshops trading on the net.

A good and comprehensive source on popular music in Finland is Rockdata, which is maintained on a voluntary basis. The site includes links to both official and fans' pages. Much of the text is also available in English. As well as introducing different bands, the pages also include a list of Finnish record companies.

The English-language pages of the Ministry of Transport and Communications provide an official source of information on the communications sector in Finland. The pages include current news, information on statutes, as well as summaries of the Ministry's annual reports and operational plans.

## In conclusion

There is quite a wide range of Finnish web publications on the net that are published by traditional media houses, but the bulk of their contents consist of material originally intended for publication elsewhere. At least so far relatively little effort has been invested in preparing fresh materials specifically for publication on the net. This is because of lack of resources: web publishing is not a profitable business, and it is expected that it will take years before the investments made will begin to pay back.

Traditional publishers are no longer on their own on the net trying to capture the attention of news audiences. During 1998 Finnish Internet service providers have expanded their own pages beyond lists of links. Sonera, the now privatized Finnish Telecom, is not the only provider aiming to expand its popular homepages into a full-service portal; in addition to Finnet Group, Scandinavia's biggest telecommunications company Telia has also joined the competition. Both Sonera and Telia also offer a news service. Brief news bulletins are now also provided by the Finnish search page Ihmemaa.

Media statistics

## 1 Mass media economy and consumption

Severe economic recession in the early 1990s played havoc with Finland's mass media economy. Total turnover in the mass media sector declined by 12 per cent from 1990 to 1993; during the same period GDP declined by 6 per cent. Since the mid-1990s, however, the mass media markets have been growing again, with the annual rate reaching around 5-6 per cent. In 1997 the turnover of the mass media sector totalled FIM 18.4 billion, up by around 5 per cent on the figure for the previous year. Mass media turnover as a proportion of GDP has remained steadily at around 3 per cent for the past ten years or so. In other words the mass media have not ranked among the growth sectors of the national economy. (Table 1.)

Figure 1.1 Mass media turnover 1980, 1990 and 1997

## Print media

Print media (newspapers and magazines, books, printed advertising material) recorded a turnover of FIM 13.1 billion and remain the dominant force in the mass media economy. Although the figure has been steadily falling since the mid-1980s, the print media still account for 70 per cent of the industry's turnover. During the past ten years the share of the print media has dropped by around 6 percentage points, mainly in favour of the electronic media. (Table 1.)

Nonetheless newspapers alone still account for almost one-third ( $30 \%$ ) of the turnover of the mass media sector: in 1997 their combined turnover was FIM 5.6 billion. During the 1990s the share of newspapers has declined by only a couple of percentage points. This is a fairly minor setback when considered against the dramatic changes in newspapers' sources of revenue and circulation trends. Today, advertising revenue accounts for no more than just over half of the takings of dailies, compared to over 70 per cent in the late 1980s (these figures include classified advertisements). During the 1990s the combined circulation of all newspapers has declined by 18 per cent from 4.1 million to 3.4 million copies. The decline finally seemed to bottom out for dailies in 1997, but for other newspapers (most of which are local papers) circulation figures are still falling.

Magazines and periodicals recorded a turnover of around FIM 3.4 billion, accounting for 18 per cent of the mass media sector. If newspapers have spent most of the 1990s struggling to survive, for magazines the past decade could be described as something of a success story. According to audit data the circulation of magazines and periodicals has been increasing in recent years. Indeed the main sources of income for magazines are subscriptions and single-copy sales, although during the 1990s the role of advertising revenue has been increasing and magazines have taken up a growing share of the total advertising cake. In 1997 advertising revenue accounted for an estimated one-quarter of magazines' takings compared to less than one-fifth in the early 1990s.

Book sales in 1997 totalled around FIM 2.3 billion. Almost 40 per cent of all books are sold through book shops, while department stores and supermarkets account for around 10 per cent. Direct sales by publishers (mostly non-fiction) account for around one-fifth, book clubs (mainly fiction) for some ten per cent and other channels for around 20 per cent. In the early 1990s book sales were adversely affected by the austerity budgets of schools and libraries. In recent years both schools and libraries have been spending somewhat more on acquisitions again, but policies have been changing: libraries are now investing a growing proportion of their monies on audiovisual materials and schools have taken to recycling textbooks.

## Electronic mass media

Electronic media have a growing share of the mass media market but still account for no more than around one-fifth of the industry's turnover. In 1997 the turnover of electronic media was FIM 3.7 billion.

Nationwide radio and television showed a turnover of FIM 2.7 billion, i.e. almost three-quarters of the total turnover of electronic mass media. The volume of business in this sector has not been growing at the pace that was widely anticipated only a few years ago. For example, the growth of television advertising during the past couple of years has been at roughly the same level as the growth rates for advertising in newspapers and magazines. Indeed during 1995-97 television advertising as a proportion of total media advertising showed no growth at all. The start-up in 1997 of Channel Four (Finland's second nationwide commercial television station) and Radio Nova (Finland's first nationwide commercial radio station) had only a minor impact on the economic volume of nationwide television and radio. In Finland television still accounts for no more than 21 per cent of total media advertising, well short of the figure of 30 per cent (1996) for Western Europe on average.

Cable television operators' takings in subscription fees for pay-TV channels (around FIM 115 million) accounted for one third of the turnover of cable television. In 1997 the turnover of cable television operators amounted to just over FIM 340 million.

The turnover of local radio stations dropped to below FIM 200 million in the early 1990s and has never recovered beyond that mark since. Neither the major changes in the structure of local radio nor the arrival of new chains of commercial stations have helped to inspire strong growth in this sector. In 1998, the turnover of local radio stations stood at FIM 190 million. Between 1990 and 1998 around 30 local radio stations were closed down or merged with other stations. However, the total number of operators has remained more or less unchanged as new actors have turned up to take on the challenge. In 1998 there were a total of 60 local radio stations in operation.

Data on the volume of electronic online information services mainly comprise business-to-business services, which in money terms is also by far the most significant sector. In 1997 a total of FIM 450 million was spent on these services. As yet consumer demand for fee-based online information services is marginal, and in 1997 companies spent no more than an estimated FIM 10 million on advertising on the Internet.

## Recorded media

Recorded media have accounted for around 6-7 per cent of the mass media economy for quite some while, but it seems that this figure is now on the rise. The phonogram markets have shown relatively strong growth during the past couple of years. In 1997, phonograms sales totalled FIM 725 million. However, a major new threat to this growth is represented by pirating, which is a booming business just across the border in the Baltic and St. Petersburg regions. Not only top-selling international artists but also domestic performers have now become victims of the pirating business.

Video rentals and sell-though showed a turnover of FIM 370 million in 1997. Sell-through videos account for around two-thirds of the markets, rentals for around one-third. The market shares of these two segments have been virtually turned upside down during the 1990s. At the beginning of the decade sell-through videos accounted for less than one-quarter of the total markets.

In 1997 sales of CD-ROMs totalled FIM 200 million, showing an increase of more than 30 per cent. In 1997 utility categories accounted for around one-third of the total markets of CD-ROMs, with games accounting for two-thirds (this latter category does not include playstation products). It is estimated that domestic products account for around half of the sales of utility CD-ROMs, in the games category domestic products account for no more than a few per cent.

In recent years the number of cinema admissions has increased, and the turnover of theatres showed yearly increase figure of around ten per cent in 1997. However, people in Finland still go to the cinema less often than people in Western European countries on average. In Finland the average number of admissions per capita in 1998 was 1.5; in most other countries the figure is around two or even over.

## Advertising

In 1997 a total of around FIM 6 billion was spent on advertising in the mass media. Advertising increased very rapidly towards the end of the 1980s, but in the early 1990s the trend was quite dramatically reversed. During the recession in 1990-1993, advertising in the mass media declined by around one-quarter ( $-24 \%$ ), and in 1996 total advertising expenditure was still at a lower level (FIM 5.4 billion) than in 1990 (FIM 5.7 billion). Indeed the volume of mass media advertising as a proportion of GDP has declined: in 1997 it was around one per cent, having peaked in 1989 at around 1.2 per cent. (Tables 3 \& 4.)

Newspapers remain a dominant force in advertising, even though their share of total media advertising has declined during the 1990s by 10 percentage points. Even so newspapers still account for over half ( $52 \%$ in 1997) of total advertising expenditure in Finland. This figure is markedly higher than the average for Western Europe ( $40 \%$ in 1996).

In contrast to the recent trends in development in many other countries, magazines in Finland have increased their share of total media advertising. In 1997 magazines accounted for 15 per cent of the advertising cake. In many other countries the share of magazines has been declining ever since the mid-1980s. The difference between Finland and the average level in Europe ( $19 \%$ in 1996) has been reduced to four percentage points from double figures in 1990.

In the beginning of the 1990s television accounted for no more than 14 per cent of total media advertising in Finland. This figure started rapidly to increase around the mid-1990s, but since 1995 it has remained unchanged at 21 per cent. Television's share of media advertising in Finland is still markedly lower than in Europe on average. In 1996 the average market share of television in Western European countries was around 30 per cent.

The share of local radio advertising has declined during the 1990s by one percentage point from 4.5 per cent to 3.5 per cent. The average figure for Europe in 1996 was 5 per cent.

Figure 1.2 Advertising in mass media 1997

## The employment effects of mass communication

In 1996 the mass media sector employed just over 2 per cent of the work force. This figure has remained essentially unchanged since the early 1980s. The statistics do not include personnel in the wholesale and retail trade of communication media nor freelance journalists. (Table 5.)

As well as representing the dominant force in economic terms, the print media in Finland are also by far the biggest employer in the mass media. On the other hand the printing industry also saw the biggest number of job losses during the recession in the early 1990s.

Posts and telecommunications employ somewhat smaller numbers than the mass media sector.

## Household mass media consumption and expenses

In 1996 Finnish households spent 4.4 per cent of their total consumption expenditures in mass media. This figure has been slightly increasing in recent years (Table 19). The biggest single expense items were represented by newspapers and magazines as well as TV licence and other TV fees. The amount of money spent on home PCs, peripherals and software is clearly increasing.

Figure 1.3 Household consumption expenditure in mass media 1996

Retail sales of entertainment electronics totalled around FIM 3.2 billion in 1997. Sales have been increasing very sharply in recent years. The biggest increase was recorded for PCs ( $37 \%$ ), TV games and consoles (144\%) and satellite packages ( $72 \%$ ). PC sales totalled around FIM one billion. (Table 18.)

Total sales of entertainment electronics did not recover to the pre-recession level until 1996. In the early 1990s the business was hit quite severely not only by economic recession but also by the lack of new and attractive mass market products. At their lowest, in 1993, sales at nominal prices stood at less than 60 per cent of the figures for 1990.

The PC market is particularly buoyant. Sales volumes are continuing to grow, and with consumers now moving on to buy more and more powerful multimedia PCs there has been no major change in the average unit prices. According to Statistics Finland's autumn 1998 consumer barometer, 27 per cent of Finnish households had a multimedia PC with CD-ROM. Almost one-fifth (19\%) of all households had access to the Internet.

## Statistical sources

Data on the turnover of the mass media in Finland are based on a wide range of statistical sources compiled at different levels. The data for many sectors are crude estimates.

Advertising investments and their breakdown by different mass media are monitored by Suomen Gallup-Media Oy. In the time series shown in Table 3, advertising planning and production costs are included in the figures for media advertising. The net figures describing the time series years 1980 and 1985 have been adapted to comply with the new calculation method used since 1988. Table 4 provides more detailed data on the breakdown of advertising in the 1990s: so-called media investments (purchases of media space) are distinguished from advertising design and production. The figures only cover advertising in the mass media; direct mail advertising, index advertising, advertising at fairs and exhibitions, sponsorship, and business gifts are not included.

The figures for industrial production, imports and exports as well as retail trade in mass communication are mainly drawn from Statistics Finland's industrial statistics and business register, the foreign trade statistics maintained by the National Board of Customs, the statistics of the Federation of the Printing Industry in Finland, and the retail statistics of the Domestic Appliances Association.

The key source for consumption expenditure in mass media in Finland is Statistics Finland's consumer survey.

Finally, data on the amount of time spent with different mass media are from the Intermedia survey by MDC Helsinki Group - Media research Ltd. Data on the amount of time spent with mass media relative to other time usage can be found in the studies conducted by Statistics Finland in 1979 and 1987/88 and from the ongoing 1999 time usage survey.

| 8 | A-lehdet | 402 | 14.3 | Magazines |
| 9 | Keski-Suomen Media | 344 | 53.4 | Newspapers, books, local radio |
| 10 | Valitut Palat - Readers'Digest | 337 | -4.4 | Magazines, books, phonograms |

* Pro forma turnover 1998. A fusion of Sanoma, Helsinki Media, and WSOY took place in May 1999.

Rautakirja Group, a major distributor of periodicals and books and owner of Finland's largest cinema chain, is also included as a subsidiary. (Approximately one half of Rautakiria's turnover of FIM 3.4 billion comes from distibution and single copy sales of newspapers and magazines, sales of books, video distribution and the distribution of films plus movie theatres).

|  | 1614.6 | 543.7 |
| 1996 |  |  |
| 1997 | 1779.8 | 653.9 |
| Change 1997/96\% | 1955.2 | 736.7 |

* A new customs tariff law entered into force in 1988. As a consequence of this change in legislation, the figures for that year are somewhat below the true values. In certain product groups comparison with the corresponding figures for previous years became more difficult. It is important to bear in mind that production has to some extent been relocated to printing shops run by Finnish companies in foreign countries .

## 2 Television

The basic structure of television broadcasting in Finland has changed quite dramatically during the 1990s. In 1993 the traditional symbiotic model of public service and commercial television was finally buried and commercial television, through MTV Finland, was detached from the public service broadcasting operations of the Finnish Broadcasting Company YLE: MTV was granted an independent operating licence and it moved to its own channel.

Since the beginning of regular television broadcasting in Finland in 1957, the commercial television station MTV had to lease its broadcasting time (approximately 20 hours a week) from the public service broadcaster YLE on the latter's TV1 and TV2. There have also been various other links of dependency between the two companies: for instance, MTV has broadcast its programmes under YLE's operating licence (until autumn 1993). MTV has also been a major source of funding for YLE in addition to licence fees. The compensation for broadcasting on public service channels or the "public service fee", as it has been described in the 1990s, was intended as compensation to YLE for lost advertising revenues. This has been a special feature of funding public service television in Finland. It has remained in place, in a slightly revised form, despite the structural changes in recent years.

YLE was also an important minority shareholder in MTV and in its subsidiary Kolmostelevisio (Channel Three). Originally founded in 1985 as a joint venture of YLE, MTV and Nokia and since 1990 a subsidiary of MTV, Kolmostelevisio broadcast on a separate channel from 1987 to 1992.

At the beginning of 1993 the public service operator YLE and the commercial MTV parted ways. Both were allocated their own channels: YLE1 and YLE2 are now reserved for public service broadcasting, while MTV3 Finland operates its own nationwide, full-service commercial network, with its own operating licence. YLE has also given up its minority holdings in MTV and Kolmostelevisio. But even today, a very substantial part of MTV's revenues goes to YLE. Legislation adopted in 1998 renamed the public service fee as the operating licence fee and at the same time made it statutory. It was also extended to apply to all television (as from 1999) and radio broadcasting (as from 2004) over the air. The fee is applicable to all companies with a turnover in excess of FIM 20 million. MTV is therefore no longer the only operator paying this fee. (Cable television is exempted, however.)

The operating licence fees from television and radio broadcasters as well as TV viewers' licence fees are collected into the State Television and Radio Fund. The assets of the fund shall be used to finance the activities of YLE but may also be used
otherwise to promote television and radio operations. The Council of State decides on the distribution of the assets of the fund for these purposes.

MTV3 is now part of Alma Media, Finland's second biggest mass communications company. Alma Media was created in spring 1998 through the merger of the major newspaper publisher Aamulehti Group and MTV3 Finland. Alma Media is also the biggest single shareholder in the country's only nationwide commercial radio channel, Radio Nova, which was launched in spring 1997.

Following the 1993 channel reform, with no technical obstacles in the way, there was no excuse any more for declining to grant an operating licence to a fourth nationwide channel that would compete with MTV for advertising money. In autumn 1996 the government granted an operating licence for Channel Four Finland (Nelonen), which started programming in summer 1997. The biggest owner of Channel Four is Helsinki Media Company (holding just over $50 \%$ of the share stock), which in spring 1999 merged with the leading Finnish newspaper company Sanoma Corporation and the largest Finnish book publisher WSOY. Sanoma WSOY is now Finland's biggest media company (measured in terms of turnover) and the second biggest in Scandinavia. Other Channel Four shareholders include the Danish-based Egmont, and Finland's fourth biggest newspaper publisher TS-Yhtymä. During its first full year in business (1998) Channel Four's share of television viewers remained at less than 10 per cent.

Competition has become much fiercer in the new situation and viewer ratings are suddenly far more important to all operators. As far as YLE is concerned the current situation is in a sense quite contradictory: On the one hand the company wants to keep its own ratings high for reasons of legitimacy; but on the other hand, for reasons that have to do with funding, it is also in YLE's interests that commercial channels have good viewer ratings.

There are now plans to set up in Finland three terrestial television networks or multiplexes that will carry a dozen or so channels as well as a range of interactive services. Initially the launch of digital programming for the general public has been scheduled for the Olympic Games in the year 2000. Digital television licences will be decided upon by the Council of State in 1999.

YLE's revenues in 1998 totalled around FIM 2 billion. Over three-quarters of this came from licence fees. Network rents and public service fees account for about 20 per cent. The share of leasing fees and compensations paid by MTV peaked in the mid-1980s when they accounted for almost one-quarter of the total of YLE's revenues. (Table 2.)

In 1997 television represented 64 per cent or FIM 1.3 billion of YLE's total expenses. In addition to its two TV channels, YLE also has public service radio broadcasting on four nationwide channels, plus extensive regional radio services. (Tables 3 \& 4.)

During the first years since the channel reform in 1993 MTV showed strong and rapid growth. In 1998 the company had a turnover of FIM 1.1 billion (Table 5). TV advertising as a proportion of total media advertising grew sharply in the early 1990s, but has remained steadily at 21 per cent in recent years. However, this share is still much lower than the European average, which in 1996 was 30 per cent.

In 1997 the Finnish Broadcasting Company had a staff of around 4700 people, of whom around 2100 were directly involved in television. The two nationwide commercial channels had a staff of just over 700, cable television companies had less than 400 employees. (Tables $8-10$.)

In 1998 just under 2 million TV licences were purchased. After the slight downturn during the recession in the early 1990s, the number of TV licences has been steadily increasing again. Nonetheless large numbers continue to watch television without a licence. In the mid-1990s, for example, it was estimated that more than 10 per cent of all households with a television set did not have a licence. (Table 2.11.)

Cable television expanded very rapidly in Finland throughout the 1980s. In 1980 there were less than 70000 households wired up to cable networks; the figure for 1985 was over 200000 ; and by the end of the decade it had risen to around 670000 . During the 1990 s the growth in the number of cable television subscribers has slowed down considerably. At year-end 1998 the number of cable subscribers was 905500 , or 39 per cent of all households. As housing companies and network operators with less than 200 subscribers do not require a licence, the data on the numbers of networks and subscribers are not fully accurate. (Figure $1 \&$ Table 12.)

Figure 2.1 Cable and satellite subscribers 1980-1998

Cable television had a turnover of FIM 365 million in 1998. Annual fees were the biggest single revenue item ( $48 \%$ ). In 1998 a total of FIM 120 million (33\%) was spent on pay-TV services. (Table 7.)

Cable programming consists mainly of programmes transmitted by international satellite operators: TV5 Europe ( 858000 subscribers), NBC Europe ( 855000 subscribers), Eurosport ( 853000 subscribers), and MTV Nordic ( 832000 subscribers) (Table 13). In terms of total subscriptions, the biggest cable networks in Finland are Helsinki Televisio Oy (Helsinki Media), Sonera Oy Kaapeli-TV (several cable networks) and Tampereen Tietoverkko Oy (e.g. Alma Media). (Figure 6.)

Satellite reception has increased quite rapidly during the 1990s. In 1998 there were a total of 285000 households ( $12 \%$ ) with access to satellite television either via a communal antenna or a separate dish. All in all, with all statistical overlap eliminated, around 1.1 million households in Finland (49\%) had access to cable and satellite networks. (Figure $1 \&$ Table 12.)

Local over-the-air television broadcasting has remained at a fairly modest level in Finland. No more than three networks are involved, and two of these operate on amateur basis.

During 1997 YLE's weekly programming on its two national channels amounted to 179 hours, up by 70 per cent on the figure recorded before the 1993 channel reform. The weekly programming volume on MTV3 was 128 hours in 1997, which is 58 hours more than the programming volumes of MTV/Kolmostelevisio before the channel reform. Channel Four's weekly programming amounted to 59 hours in 1997. (Table 14.)

Both YLE and MTV made some changes to their programming in connection with the channel reform. This was no surprise in view of the fact that both companies had to build up full-service programming packages for their channels, YLE for two and MTV for one channel.

The main accent in TV1's programming is on news, current affairs, information and documentaries. TV2 concentrates on information and documentaries, films, serials and sports. MTV still leans more heavily towards entertainment than YLE, although it has diversified to an increasing extent since the reorganization in 1993. Channel Four is primarily oriented in its programming to entertainment. All channels have children's programmes, but most educational programmes appear on TV1. (Table 15.)

Domestic production accounts for a large part of the programming of both YLE and MTV. In 1997, 54 per cent of YLE's programming was domestic; the figure for MTV was the exactly same, 54 per cent. One-fifth of MTV's programmes were purchased from independent domestic production companies, while the corresponding share for YLE was only 8 per cent. (Table 16.) Except its news services, Channel Four, which was started up in 1997, purchases all its domestic programmes from independent production companies. - Some of the biggest so-called independent TV production com-
panies in Finland (Table 6) are nowadays controlled by larger media houses. Also the world's biggest TV drama producer Grundy, which is part of the British Pearson Group, established a subsidiary in Finland in 1998.

YLE's and MTV's foreign programming differ from each other very clearly. In 1997, the majority of YLE's foreign programmes were of European origin, whereas most of MTV's foreign programming comes from North America. The representation of other continents is insignificant. (Table 17.)

In 1998 the combined average daily reach of YLE's two channels (TV1 and TV2) was 64 per cent of the population, or almost two out of three Finns aged 10 or over; the figures for TV1 and TV2 were 56 per cent and 49 per cent, respectively. The daily reach of MTV3 was 60 per cent, i.e. almost the same as the combined figure for the two YLE channels. The daily reach of Channel Four was 27 per cent and that of satellite channels 12 per cent. (Table 18.)

The average viewing times were 2 hours 29 minutes a day (not including video viewing). The annual figures have been increasing during the 1990s, but in 1996 the growth came to a halt. The two YLE channels take up 46 per cent of television viewing time (excluding video) and MTV 42 per cent. The channel share of Channel Four was 7 per cent in 1998. (Figure 2; Tables 20-23.)

Figure 2.2 Breakdown of television viewing by channel in 1998

Children and young people (aged 3-24 years) watch television much less than the average. After childhood and youth, television viewing increases steadily with age. (Tables 19, $21 \& 23$. )

The average reach of teletext services on an ordinary day is around 15 per cent of the population. The use of these services is higher than average among men and young people. (Tables 25 \& 26.)

Just over 40 per cent of households had at least two television sets in 1998. It is estimated that there were a total of around 3.3 million television sets in homes, or 1.5 sets per household. In spite of the growing popularity of morning programmes, only four per cent of households had a television set in their kitchen. (Tables 29 \& 30.)

## Statistical sources

Most of the data on finances, broadcasting volumes and staff numbers of television companies are from the annual reports of the respective organizations.

Data concerning the programming structure of the companies are based on the companies' own reports.

Data on cable television operations in Finland are published annually by the Ministry of Transport and Communications.

Statistics on the number of households with a satellite is compiled by the Satellite and Antenna Association.

Statistics on television viewing are based on summary reports from year-round panel surveys conducted by Finnpanel Oy . The sample consists of 530 households and a total of 1250 persons. The metered audience measurements have been jointly commissioned by YLE, MTV, Channel Four Finland and the Finnish Association of Advertising Agencies.

The data concerning the number and location of television sets in households are derived from extensive annual basic studies that have been carried out since 1995 by Finnpanel Oy to control the sample of metered audience measurements.

\section*{3 Radio}

The radio scene in Finland has changed completely since the mid-1980s. The first commercial local radio stations went on the air in 1985. Following a brief trial period, the number of private stations increased very rapidly. The number peaked in 1990 at almost 70 ; since then the figure has slightly come down. The coverage of local radio stations (which means the number of people who have access to any commercial local radio station) is estimated at around four million; this means that around four in five people in the country live within the coverage area of some local radio station.

Financially, the whole of the 1990s has been an uphill struggle for commercial local radio stations. Neither the major restructuring exercise nor the arrival of new chains of commercial stations have helped to inspire strong growth in the sector. In recent years the turnover of the sector has been at a much lower level than before the severe economic recession in the early 1990s (Figure 3), accounting for no more than around one per cent of the total turnover of the mass media sector in Finland.

Major steps have been taken towards deregulation in recent years in order to improve the financial prospects of commercial radio broadcasting. Requirements concerning local broadcasting have been significantly slackened to allow for closer cooperation between individual stations as well as the setting up of chains of local radio stations. In addition licences have been issued to format radios operating in different localities. In 1994 licences were granted to Classic FM (Great Western Radio) and to Kiss FM (Scandinavian Broadcasting System), which broadcast identical programmes in several cities. In spring 1999 four further companies were granted licences for a similar operation, and the French company NRJ which used to operate only in the metropolitan Helsinki region was now given the go-ahead to expand to other cities as well. Spring 1999 also saw the formation of Radio Plus, the biggest chain of network cooperation: a total of 13 local radio stations are involved.

The country's first nationwide commercial radio station received its operating licence in autumn 1996: Radio Nova went on the air in spring 1997. Radio Nova has grown very rapidly and become a serious challenge to YLE's nationwide channels and to local radio stations as well. Radio Nova's biggest shareholder with a \(48 \%\) stake is Alma Media, Finland's second-largest media company.

In response to the growing competition in the mid-1980s, the public service broadcaster YLE decided to increase its air-time and to re-profile its radio programming. YLE also upgraded its third channel into a nationwide network. At the same time YLE greatly increased the volume of its regional programming.

In 1990 YLE pursued this re-profiling even further, setting up YLE Radio 1 as a station for classical music and culture programmes; Radio 2 (or "Radiomafia") was re-profiled as a young people's pop and rock channel; and Radio 3 (or "Radio Finland") was set up as a news, current affairs and regional programmes channel. Additionally, Swedish-language programming was reorganized in autumn 1997 into two channels. Radio Vega is intended for more mature audiences, resembling a full-service channel. Radio Extrem is aimed at younger listeners.

In addition, YLE has started digital radio broadcasting in autumn 1998. The programming for the digital talk radio channel Radio Peili ("Radio Mirror") is compiled from the programmes broadcast by YLE on its analogue nationwide channels. The start-up has been slowed down by the poor availability and the high price of receivers, and therefore, in parts of southern Finland, the channel decided to broadcast in analogue format as well. In early spring 1999 the number of receivers in use was no more than a few dozen.

In terms of economic volume the radio operations of the public service broadcaster YLE are about 3 times greater than in commercial broadcasting (with programming costs for 1998 standing at about FIM 670 million) (Table 2). The difference in the scale of the operations and in resources is also clearly reflected in staff numbers. In recent years staff numbers in YLE's radio operations have slightly increased. In 1997 there was a permanent staff of around 1,400 . The corresponding figure for local radio stations was around 500 , with the number of staff working on a freelance basis down to 350 . Staff numbers have steadily declined in the commercial radio sector throughout the 1990s. (Tables 8 \& 9.)

Local radio stations get around 90 per cent of their takings from advertising (Table 4). In 1997 radio accounted for 3.5 per cent of total media advertising, which is one percentage point less than at the beginning of the decade. In Western European countries radio accounts on average for some 5 per cent of total media advertising (cf. Table 3 in Chapter 12).

Although some 30 commercial local radio stations have been closed down or merged with other stations during 1990-98, the total number of operators has remained more or less unchanged as new actors have turned up to take on the challenge. The stations that went out of business during the early years of local radio were typically setups operated on a more or less amateur basis in small local municipalities. During the years of recession in the early 1990s, however, stations also went under in larger towns that had two or more rival stations.

The competition for advertisers' money has intensified further with the arrival of format radio stations operating in several different areas (Kiss FM/SBS \& Classic FM/GWR) and with the start-up of the nationwide commercial station Radio Nova. The competition is fiercest in the Helsinki metropolitan region where there are now a dozen or so radio stations that are commercially financed.

The start-up of Radio Nova was a great success. During its first six months on the air its audience share in its primary target groups (the audience aged 25-44) was one-quarter. The losses have been felt equally by YLE's public service radio channels and by local radio stations. (Tables 18 \& 19.)

It was through local radio stations that the concept of broadcast flow was introduced in Finland. YLE has also adopted this concept on some of its channels. In line with international trends, music has become the most important element in creating the profile and style of many Finnish radio stations. Music is also a crucial part of the programming on YLE's channels (cf. Table 13). YLE's youth channel Radiomafia has followed the example of many commercial stations and adopted the selector or weekly playlist system which identifies the songs that may be broadcast by on-air personnel.

The volume of radio broadcasting in Finland is quite impressive. In 1996, YLE's weekly broadcasting through its five nationwide channels amounted to around 650 hours. The growth has been fastest for regional programming, increasing almost five-fold from less than 200 weekly hours in the mid-1980s (operational year 1985/86) to almost 900 weekly hours in 1997. As the majority of private radio stations operate around the clock, their combined weekly broadcasting volume probably amounts to almost 10000 hours. (Tables 10-12.)

Figure 3.1 Channel shares in radio listening 1998

During the early 1980s there was a clear drop in the total reach of radio (i.e., the share of the population tuning in to at least one radio station on an average day), but with the mushrooming of local radio stations the figure began to rise again towards the end of the decade. In recent years the daily reach of radio has been at around 80 per cent of the population, but during the past couple of years the figure has slightly dropped. (Table 14.)

The beginning of local radio brought a significant increase in average listening times. Towards the end of the 1980s average daily listening times increased from over two to over three hours. Since YLE's radio reform listening times increased even further, peaking at almost four hours a day. More recently the figure has slightly declined again, and now stands at 3 hours and 20 minutes a day. (Table 16.)

In 1998 people spent about 2 hours listening to YLE's channels every day. The nationwide commercial station Radio Nova took up half an hour and other commercial radio stations around 45 minutes of the average daily listening time. (Table 16.)

In 1998 households had on average 3.4 radio sets, with the total estimated number of sets in households standing at around 7.5 million. Table 22 shows the rooms in which radio sets are mostly used in Finnish homes.

The factor that best explains radio listening is age. Older age groups spend much more time with the radio than do younger people. (Tables \(15,17 \& 19\).)

\section*{Statistical sources}

The figures describing the volume of national public service radio broadcasting are from YLE's annual reports and yearbooks.

The data on the volume, economy and personnel of privately-owned local radio stations come from the Ministry of Transport and Communications (which requires regular reports on operations) and from the Association of Finnish Radio Broadcasters.

Commissioned by the Ministry of Transport and Communications, the Turku School of Economics Business Research Center has used questionnaire data to compile annual reports on the finances of local radio stations. The reports have been published since 1990.

In previous years YLE used to conduct diary studies a few times a year to study patterns of radio listening. The samples for these studies comprised over 1000 people in the population aged over 9 . Since 1991 the most important listening survey has been Finnpanel's National Radio Survey, the materials of which are used by YLE and the Association of Finnish Broadcasters in their own reporting.

The data on the number and location of radio sets in households come from the extensive baseline surveys conducted by Finnpanel for its TV-meter study.

\section*{4 Phonograms}

The Finnish phonogram markets have been picking up during the past couple of years. In value terms, sales are now at a higher level than they were in the pre-recession years in the early 1990s. However, the numbers of copies sold are still at a much lower level than around the turn of the decade.

Following a long period of relatively steady growth, the Finnish phonogram markets took a downward turn in the early 1990s. During the 1980s annual sales of phonograms had increased from around 10 million to 16.5 million phonograms (an estimate based on adding imports to domestic production). Sales then declined very sharply, dropping to around 10 million phonograms in 1993-94 (Table 1). In 1998 a total of about 12 million phonograms were sold in Finland. This translates into 2.3 phonograms per capita, which is clearly less than the corresponding figures in Norway and Denmark (around 3.5) and slightly less than in Sweden (2.9). (Table 14 in Chapter 12.)

Figure 4.1 Phonogram sales 1980-1997

The phonogram markets have long been dominated by CDs. In 1998 CD sales totalled 11 million copies; the figures for cassettes were 1.3 million. As for CD players, compared to other Scandinavian countries consumers were initially quite slow to pick them up. According to Finnpanel's household equipment survey, 60 per cent of Finnish households had a CD player in 1998. Yet the rate of penetration still remains lower than in the other Scandinavian countries, where by 1997 up to \(70-80\) per cent of households had a CD player. In Finland the rate of penetration began to increase more clearly with the arrival of the cheaper version of the CD player, i.e. the radiocassette recorder with CD-player, which still is more common than the separate CD player. (Tables 10-12.)

Measured in numbers of phonograms sold, the Finnish phonogram markets have long been more or less evenly divided between domestic and foreign products. In value terms, however, imported phonograms sell more than Finnish phonograms. This is explained by the dominant market share of CDs in the sale of foreign phonograms. Until recently, C-cassettes have continued to account for a large proportion of domestic phonogram sales. (Tables 3-5.)

Another indication of the strong role of domestic phonograms is that on the list of all-time long-play bestsellers, there are 31 Finnish as compared to only six foreign phonograms that have sold over 100000 copies. (Cf. table 9.)

Vinyl records have all but disappeared from the mass markets and turned into a niche market for afficionados. The C-cassette has been more successful in retaining its position, particularly in the market for domestic phonograms. However, Mini Disc is now emerging as a serious rival to the C-cassette for recording uses in the home: in the longer term this format certainly has the potential to take over from the C-cassette as an everyday recording medium.

In 1997 a total of almost 3000 domestic phonogram titles were published in Finland. However, it is important to note that a considerable part of cassette production consists of other than music titles. The biggest single non-music category was represented by spiritual material, followed by language cassettes. The total number of phonogram titles published each year is also pushed up by reproductions of old recordings and the publication of the same recording in different formats (e.g. in CD and cassette). (Table 2.)

The process of vertical international integration of the Finnish phonogram business was completed in the early 1990s. Warner Music started up in Finland in 1989. In 1991 Polygram took over Scandinavia's biggest record company Sonet complete with its subsidiaries (including Sonet Finland), and the following year founded its own subsidiary in Finland. BMG set up a Finnish subsidiary in 1991. BMG was also MCA Universal's distributor in Finland until 1998, when the Universal Music Group established its own office in Finland. The big multinational companies Sony and EMI started subsidiaries in Finland much earlier in the 1970s. In 1997 the five
biggest multinational players together accounted for 56 per cent of total phonogram sales in Finland. (Figure 2.)

In 1993 one of the most traditional companies in the business Fazer Musiikki was taken over by Warner Music Finland. Fazer has an impressive backlist of music by Finnish artists.

The major labels are very much in control of imports and domestic production. However, ever since the 1970s and 1980s there has been growing up a network of small independent producers, the number of which has apparently continued to increase. According to Statistics Finland's Business Register, there were a total of 129 record companies and recording studios in Finland in 1984. In 1996 the number of phonogram publishers was 249 .

Listening to phonograms has tended to decline in recent years: less than one-fifth of the Finnish people now listen on a daily basis to phonograms, whether purchased or borrowed. In 1990, the corresponding proportion was still around one-quarter. The average listening time is around 20 minutes a day. Youths and young adults are particularly active in this respect, though on the other hand it is precisely in these age groups that listening has declined most (Tables \(6 \& 7\) ). At least part of the reason for the declining use of phonograms lies no doubt in the fact that many radio stations are now playing music virtually non-stop.

Figure 4.2 Market shares of phonogram sales 1997

\section*{Statistical sources}

The main sources on the phonogram business are the Finnish Composers' Copyright Society (Teosto), the Finnish Group of IFPI, the National Board of Customs' foreign trade statistics, and the Helsinki and Jyväskylä university libraries, which maintain lists of domestic recordings on the basis of the free copies they receive of all production.

The Finnish Group of IFPI also compiles statistics on the annual sales of its member companies, providing numbers for both total value and number of copies sold. Using these statistics as well as data from Teosto and foreign trade statistics, the Finnish Group of IFPI also draws up annual estimates of total sales in the Finnish phonogram business. In recent years IFPI member producers have accounted for around 80 per cent of the estimated total value of phonogram sales and for 70 per cent of the copies sold.

Data from the monthly national radio surveys conducted by Finnpanel, a market research institute specializing in the measurement of radio listening and television viewing, also include information on daily reach of phonograms and the amount of time spent listening to phonograms.

From 1987 to 1992 annual statistics published by the Ministry of Education on public libraries included information on libraries' recording collections and lendings. However, since 1993 the data covered by these statistics have been significantly reduced.

\section*{5 Video}

Video rentals started in Finland at the beginning of the 1980s. Initially the market expanded very rapidly and by the mid-1980s its turnover exceeded FIM 200 million. Video rentals were very much the mainstay of the video business for many years. It was not until 1988 that the share of sell-through videos reached 10 per cent of total turnover. By the end of the decade the structure of the video market began to change: the growth of video rentals slowed down and started to decline while the market for sell-through videos continued to gather momentum. (Table 1 and Figure 1.)

Video sales have shown sustained growth until quite recently, contributing to the favourable overall market trends. In 1997 the total turnover of video recordings was around FIM 420 million, two-thirds of which came from sell-through videos (Table 1). The turnover of video rentals has also shown some growth during the past couple of years, for the first time since the late 1980s. The rental market has obviously benefited from the lowered price levels: it is estimated that within the past few years the average rental prices have dropped by around one-quarter (Table 2).

Figure 5.1 Video distribution turnover 1980-1998

The decline in the video rentals market has been clearly reflected in the declining number of video shops: at one stage the small rental shops that were set up during the early years of enthusiasm all but disappeared. Now, as the rental business has been picking up, new shops have been opened again. According to estimates published by the Finnish Film Distributor's Association, businesses specializing in video rentals had a total of 150 outlets across the country in 1997. (Table 5.)

As the market for sell-through videos expanded, more and more shops included video recordings in their selections. Today videos are sold in various kinds of shops. As some only sell videos occasionally, it is obviously difficult to estimate the total number of video outlets. The main outlets which sell videos include department stores, bookshops and supermarkets. It is estimated that there are a total of 1500 sell-through outlets at the moment. The share of specialist shops is smaller among sell-through outlets than rental shops. (Table 5.)

The sell-through videos on the market are not entirely the same as rental videos or the films that are shown in cinemas. Whereas most rental videos are feature films, sell-through videos offer a much wider range of material, including videos related to leisure activities, keep-fit videos, children's programmes, music videos, etc.

Most of the video material comes from the United States. In Finland all programmes and films intended for video distribution must be examined by the Finnish Board of Film Classification or reported to the Board. In 1997, almost half of these videos were produced in the United States (Table 3). Some of the videos examined by the Board are intended for small designated groups, including "video magazines" for the deaf and videos on various leisure activities. The majority of these videos that are distributed among others by various organizations and institutions and videos on the lists of mail order companies come from other countries than the United States. Accordingly the share of American videos in video rental shops and sell-through outlets exceeds one-half. The share of domestic films in both the rental and sell-through category is very small.

There are 20 or so companies that import videos to Finland, but there are no more than a handful of significant players in turnover terms: all of these represent American film companies. The undisputed market leader has been Finnkino, which now belongs to the Rautakirja Group, the country's leading newspaper and magazine retailer and a major force in the retail trade of books. Finnkino was taken over in 1994 by Rautakirja and merged with Europa Vision, Rautakirja's video distribution company and market leader at the time. In 1997 Finnkino controlled 30 per cent of the video recordings market (Figure 4). Finnkino also owns Finland's largest cinema network and imports films for cinema distribution.

Finnkino's position in the video market is now changing, however. In 1996 it lost its representation of Disney's sell-through videos, which are now distributed by Disney's own distribution company Buena Vista. Buena Vista also controls the cinema distribution of Disney films. Finnkino has given up its chain of video rental shops, too.

The number of VCRs in Finnish households is continuing to increase slowly but steadily. In 1997 more than two-thirds of Finnish households had a VCR (Table 11). In certain socio-economic groups ownership of VCR is at an even higher level. For example, in 1996 four out of five entrepreneur or worker households had a VCR (Table 12). Among pensioners only about one in three households have a VCR. (Figure 2.)

During the worst years of recession in the early 1990s, VCR sales declined by almost one half. Sales have now been improving again and have almost returned to the pre-recession level. Camcorder sales have also picked up. (Table 9.)

Until 1998 there have been changes in the use of VCR in the 1990s. The average daily reach of video has remained steadily at around ten per cent of the population (Table 6). The average daily viewing time has also remained more or less the same at just over ten minutes a day. In 1998, however, both the daily reach and the average viewing time did decline to some extent (Table 7).

The viewing of programmes recorded from television is far more common than viewing sell-through or rental videos. In 1998, three-quarters of total video viewing time was spent on viewing programmes recorded from television. (Figure 6.)

On average households with a VCR bought two video recordings and rented five videos in 1997. These figures are based on statistics compiled by the Finnish Film Distributors' Association, according to which a total of three million video recordings were sold in Finland last year. The total number of video rentals was around seven million. (Table 2.)

Figure 5.2 Household ownership of VCRs by socio-economic status 1996

The number one rented video in 1997 was Independence Day. Generally the top ten list of sell-through videos is dominated by Disney's animations and other American children's movies. In 1997, however, the number one spot was held by the re-released Star Wars trilogy. (Table 8.)

\section*{Statistical sources}

Statistics on annual sales of video recordings are compiled by the Finnish Film Distributor's Association, which provides figures for both the total value and number of copies as well as for the shares of rental and sell-through videos.

The metered television audience studies carried out by Finnpanel since 1987 also include data on the use of VCRs. Detailed information on the use of VCRs is also obtained from the video surveys commissioned by the Ministry of Education in 1984, 1986 and 1989 and from the leisure survey carried out by Statistics Finland in 1991.

Statistics on the sale of VCRs and camcorders are compiled by the Domestic Appliances Association. These statistics are based on wholesalers' deliveries to retailers and on foreign trade statistics.

Statistical sources on video recordings have become scarcer in recent years. Since 1993 public libraries have no longer collected data on their video collections or on the number of lendings. The Finnish Composers' Copyright Society (Teosto) has also discontinued its statistics on the domestic production of videos on account of problems with comprehensiveness: Teosto was only receiving information on production in those companies with which it had a duplication contract.

Unlike previous statistics on Finnish mass media, this report does not refer to statistics on the imports of video recordings and blank videos maintained by the National Board of Customs. These statistics were always somewhat problematic in that the country of origin did not refer to the country where the contents were produced but to the country where the technical product was produced/duplicated. In addition, the estimation of numbers imported to the Finnish market was complicated by the re-export of cassettes and video recordings.

Customs declarations in connection with imports and exports to and from Community countries have no longer been required in Finland since it joined the European Union and its internal market. As from the beginning of 1995, statistics on foreign trade between these countries have been compiled on the basis of Intrastat statistical reports. Statistics on trade between Finland and non-EU'countries is still based on customs declarations. The main problem caused by these changes to video statistics is that Intrastat reports are based on the weight of goods rather than unit numbers.

\section*{6 Films}

The changes that swept the Finnish film scene in the 1980s have to some extent continued during the 1990s. In the 1980s, cinemas and film importers were faced with a serious stiffening of competition: films were now being rented and sold on video, and at the same time national television channels were screening more and more films every year. A particular concern for theatres and film offices was that the number of cinema-goers was steadily declining.

The film sector resorted to various strategies at the same time. Firstly, the number of theatres was reduced during the 1980s by around 50; a further 30 have been closed down during the 1990s. At year-end 1998, there remained no more than 232 cinema theatres in Finland. The nature of theatres also changed. Old theatres with one or two large auditoria were divided into smaller units, and any new cinemas that were opened were multi-screen theatres. Therefore, in spite of the declining number of theatres, there has been hardly any change in the number of auditoria. (Table 3.)

Figure 6.1 Films shown, premieres and average number of showings per film 1980-1998

Now, as we approach the millennium, a second wave of changes has got under way. This has seen the opening in late 1998 of the first megatheatres with ten or more auditoria. For the film-goer the new and refurbished theatres also provide for a more enjoyable experience: for the first time in a long while, serious efforts are now being made to raise service standards in cinemas. In this regard Finland clearly lags behind the development in other Western European countries.

The reforms in the structure of cinema theatres were soon followed by changes in their programming. First of all the number of films shown was sharply reduced during the 1980s and to some extent in the early 1990s. In 1998 a total of 384 films were screened in Finland's theatres, more than one thousand less than in 1980. The number of premieres also dropped to some extent in the 1980s. Although this figure has remained more or less unchanged during the 1990s (152 premieres in 1998), there has been a definite trend towards a larger proportion of new films in that the total number of films shown has been sharply reduced. Indeed the number of premieres as a proportion of the total annual number of films in circulation has almost doubled to 40 per cent. Film offices and theatres have changed their strategy: their aim now is to turn out a better result with a smaller number of films. (Table 2 and Figure 1.)

The reduced number of films shown has also implied a growing number of showings per film. In recent years the average number of showings per film has been over 300: this is three times more than in the mid-1980s (Table 2 and Figure 1).

In. 1994 one of the biggest operators in the film business, Finnkino, was taken over by Rautakirja Group, which has operations in several retail sectors. Finnkino had been in serious financial straits and the search had been on for a buyer for quite some while. Finnkino had long been the biggest importer of films in Finland, accounting for around 50 per cent of all theatre premieres (Table 5). The market share of other film offices has been in the region of just over ten per cent. The market share of Finnkino is now set to decline: the company has said it will be investing more in its cinema theatres at the expense of distribution.

There have also been other changes in the import and distribution of films. The distribution of films from US studios has been reorganized and new film offices have set up in Finland. Disney's films are now imported by the studio's own distributor Buena Vista. Columbia TriStar has also joined forces with the Danish operator Egmont to set up a film office, which will also be distributing films from Fox's studios. For domestic film producers it is noteworthy that these new film offices have also taken domestic films on board; previously the distribution of domestic films was handled almost exclusively by Finnkino.

Finnkino has also played a major part in the screening of films. When the company was founded in the early 1980s to continue the operations of three major cinema chains, it took over no less than 135 cinemas. Most of these were sold off or clo-
sed down as part of a reorganization scheme. Since the takeover in 1994, a new programme has been launched to reorganize Finnkino's network of theatres. The company has sold off some of its theatres specialising in high-brow films at least in Turku and Helsinki. With the money and the backing of the Rautakirja Group, Finnkino is now much better placed to invest in its theatres. Indeed in early 1999 a new multiplex theatre with 14 auditoria was opened in Helsinki. In addition, the company has plans to open new theatres in some of the biggest cities around the country.

At year-end 1997 Finnkino had 26 theatres with a total of 74 auditoria in nine different cities. This means that Finnkino controls just under one-quarter of all auditoria in Finland. Finnkino is also involved in the distribution of films on video. (see Chapter 5.)

Foreign companies have recently entered not only the radio and television market in Finland but also the cinema theatre business. Sandrews-Metronome, which is in joint Swedish, Danish and Norwegian ownership, joined forces with a few domestic operators to open a theatre with 10 auditoria in Helsinki in 1998. Prior to this the new operator had already acquired one theatre in Helsinki.

The increase in the number of films shown on television has continued. The number of films screened by the nationwide channels YLE TV1 and TV2 as well as MTV3 has tripled during the past ten years: in 1986 the three channels screened a total of 329 films, in 1997 the figure was 1028. Channel Four Finland, which was launched in summer 1997, screened 150 films during its first six months. (Table 8.)

Figure 6.2 Cinema admissions per inhabitant and Box Office receipts 1980-1998

Films are also screened by pay-tv channels. In 1997, Canal Plus screened some 1000 films to its satellite and cable subscribers (Table 8). Canal Plus was merged in 1997 with Nethold, owner of the Filmnet channels: since this merger all Filmnet channels accessible in Finland were changed into Canal Plus channels. In addition, viewers in Finland can get two pay-tv film channels (TV1000) operated by the Modern Times Group.

During the 1990s the annual number of cinema admissions has remained at the same low level to which it dropped in the 1980s. Today, the average number of cinema admissions in Finland is 1.2 per year; at the beginning of the 1980s the average was still two admissions a year. In many Western European countries people go to the cinema far more often (on average twice a year) than they do in Finland, and that figure has actually been increasing during the 1990s (see Table 13 in chapter 12 International comparisons). However there are signs even in Finland that the numbers are picking up: in 1997 the number of admissions increased by eight per cent and in 1998 by a further eight per cent. In 1998 a total of 6.4 million cinema tickets were sold and total Box Office receipts amounted to FIM 244 million. (Table 3 and Figure 2.)

At the moment, especially the popularity of domestic films seems to be improving. In the darkest years of the 1990s just over 200000 people went to see a Finnish film, whereas in 1998 the total audience figure of domestic films approached 700000 and in 1999 it reached one million already in the first four months. The popularity of Finnish film has thus returned, for the moment, to the level where it was in the mid 1980s. (Table 2.)

\section*{Statistical sources}

The annual film statistics published by the Finnish Film Foundation is an important data source on the Finnish film industry. The publication includes statistics on the number of cinema admissions, cinema operations, domestic film production and imported films as well as film showings. Data are also included on films screened on television and on video.

With the exception of feature films shown on television, the Finnish Board of Film Classification examines all films intended for public showing in Finland. The Board maintains statistics on the films it has reviewed and graded.

Data on films shown on television have been obtained directly from the respective television companies. Data on the viewer ratings for televised domestic films are from the Finnish Film Foundation's publication.

\section*{7 Books and libraries}

Book publishing has shown strong growth during the past twenty years. In 1997 the total number of book titles published in Finland was almost 12000 , which is about one-quarter up on the figure for 1990 and twice as many as in 1980 (Table 3 and Figure 1). This figure includes all categories and all types of literature: fiction and non-fiction titles issued by publishing houses and publications from other sources such as public administration, universities and organizations. It also includes small publications ( \(5-48\) pages), which account for just over one-quarter of the total number of titles. Most of the literature published in Finland is in the non-fiction category: in 1997 non-fiction accounted for 86 per cent of all titles. The number of titles in both the fiction and non-fiction category has increased.

It is quite interesting to see that book publishing has grown so vigorously during the past couple of decades: after all this has often been regarded as an era marked first and foremost by the growth and expansion of electronic mass media. However, it seems that the continuing growth of radio and television has had no adverse effects on book publishing.

Figure 7.1 Published fiction and non-fiction books in 1980-1997

Indeed there is no reason why one sector of mass communication should have to suffer from expansion in another. This kind of zero-sum assumption would mean that the mass media in question shared the same methods of production and the same fields of consumption. This, however, is not the case with radio/television and literature (at least with several segments of non-fiction). For instance, reports published by research institutes and government agencies have a certain role to play in their operation, and it is hard to imagine radio and television, as we known them today, taking on that exact same role.

By contrast it is easy to see that non-fiction publishers may find various possibilities of growth and expansion in the modern mass media, in multimedia and in the World Wide Web. Multimedia technology provides access to a very graphic means of communication which allows for the simultaneous use of many different information formats. The World Wide Web, for its part, provides an instant and relatively inexpensive publishing channel. It is particularly well-suited to publishers for whom easy access and wide circulation are important considerations. In addition, even before electronic shopping becomes commonplace, the web also offers a convenient channel of distribution for non-profit organizations: for instance, many government reports are published on the net. In the category of professional literature the prospects for growth and expansion are further improved by the ready access in the workplace to computers and the Internet.

The growth of new media has not yet had any impact on the numbers of book titles published, however. The number of titles has dropped marginally during the past couple of years, but it remains to be seen whether this is just a blip or perhaps the beginning of a long-term trend. If parallel publishing (with the same publication published on paper and in electronic format) increases, it is unlikely that the number of books will decline very much.

There are various reasons for the growth of book publishing. Some of these reasons have to do with the changes that have happened in the publishing environment and in publishing philosophies. High visibility has become an increasingly important concern, at the same time it is also possible that the tendency towards management by results has caused mounting pressures in the publishing business: after all books are an easy and convenient result to measure. It is also possible that there have grown up new areas of expertise and new audiences, each with their own specific literature.

One important factor that has certainly affected all publishers is the development of DTP and image processing software, which has made the technical production of books much easier and far less expensive than before. All this has significantly lowered the threshold of book publishing.

Around two-thirds of all books published in Finland are domestic literature in either Finnish or Swedish, the country's two official languages: in 1997 this category accounted for a total of 8341 titles. The publication of translated literature in-
creased sharply in the 1980s, but almost came to a halt at the beginning of the 1990s. In 1997, nearly 2000 titles or about 15 per cent of all books published in Finland were translated from foreign languages. (Table 3 and Figure 2.)

The publishing of foreign language literature has increased dramatically. The number of titles published in foreign languages has grown much faster than the number of books published in Finnish or Swedish. In 1997 a total of 2439 books were published in Finland that had a foreign title, which is 75 per cent more than in 1990 and three times as many as in 1980. This development is explained by the ongoing trends of internationalization, both in terms of publishers' operations and their orientation. (Table 3 and Figure 2.)

There have been no major changes in recent years in the breakdown of translated literature by source language. Well over half of all translations into Finnish are from the English language (Table 6). The second most common language of origin is Swedish. German and French books account for about six per cent of all translated literature. At least in the light of these statistics it seems that Finland's membership of the European Union has had no impact on the cultural orientation of book publishing in Finland.

As was pointed out above, only part of all books titles are published by publishing houses proper. The statistics of the central organization representing book publishers, the Finnish Book Publishers' Association (FBPA), provide a useful overview of member publishing operations (Tables 7-9). The members of the Association publish about half of the total annual volume of titles issued in Finland. In value and volume terms they have accounted for about 90 per cent of total sales.

Figure 7.2 Published Finnish, translated and foreign language books in 1980-1997

Publishing houses publish roughly the same amount of fiction, non-fiction/major works, encyclopedic and reference books and school books. In volume terms, however, fiction has accounted for a slightly larger proportion of total sales than non-fiction and school books. Non-fiction accounts for a larger proportion of net revenues than fiction and school books, which is because non-fiction and especially major works are more expensive than other books. (Tables 7 and 8.)

In 1997 the total turnover of book sales was FIM 2.3 billion. Bookshops accounted for just over one-third of total sales at retail prices. Direct sales by publishers was the second most important sales channel. (Table 2.)

There have been some changes in the sales channels of books since the late 1980s. The number of bookshops has decreased from 480 to 413 in 1996. The number of second-hand bookshops has also declined. (Table 10.)

\section*{Libraries}

Finland has a very extensive network of public libraries. Public libraries have a total of around 1200 outlets: main libraries, branch libraries, institutional libraries, mobile libraries and boat libraries. The number of outlets has decreased by about one-third since the beginning of the 1980s; in 1980 it still stood at about 1 800. (Table 13.)

Figure 7.3 Book sales by type of literature 1985-1997

The use of libraries is increasing all the time. In 1997 a total of 102 million items were borrowed, which is one-quarter more than at the beginning of the 1990s. Lending statistics clearly illustrate how the profile of libraries has been expanding from books towards other material: during the period between 1990 and 1997 the lending of other material (mainly phonograms and videos) has doubled to 21 million. At the same time the share of other material of all lending nearly doubled to 20 per cent. (Table 15.)

It is interesting to compare book lending through libraries with book sales by publishing houses. In 1997 a total of 81 million books were borrowed from public libraries, while members of the Finnish Book Publishers' Association sold around 26 million books. It has to be remembered, of course, that books which are bought by private persons also have more than one reader. (Tables 8 and 14.)

The increased use of libraries is partly explained by their growing clientele. In 1997 there were a total of 2.5 million borrowers, or some 300000 more than at the beginning of the decade. The number of borrowers as a proportion of the population increased during the 1990s by almost five percentage points. By 1997, almost half of all people in Finland borrowed material from public libraries. However, the increased number of borrowers does not fully explain the increase in the number of items borrowed, because during 1990-1997 the number of lendings increased from 39 to 41 per borrower. (Table 15.)

The collections of public libraries have been growing, though not as quickly as in the first half of the 1990s. In 1997 the total number of titles in library collections amounted to 40 million. At the same time as the number of books acquired has slightly declined, the acquisition of other material has been slightly increasing. In volume terms, however, books still account for the majority of acquisitions. In 1997 public libraries acquired a total of 1.6 million copies of books and 0.3 million copies of other material. (Table 14.)

\section*{Statistical sources}

Since 1954 statistics on new book titles published in Finland have been compiled by the Helsinki University Library, which receives free copies of all new titles from printing shops and publishers. The classification is based on Unesco's recommendations for compiling book statistics. The Finnish Book Publishers' Association compiles annual statistics on the production of its member publishers. These statistics provide data on the titles published as well as sales by value and volume for different categories of books. The earlier division into general-interest publishers and smaller publishers is no longer applicable and has therefore been abandoned.

Other sources on book publishing and sales include Statistics Finland's industrial statistics, the sales statistics of wholesalers and retailers, as well as the yearbook on Finnish companies.

Statistical data on the operation of public libraries are compiled and published by the Cultural Department of the Ministry of Education. From 1993 onwards the amount of statistical data collected from libraries has been reduced. Data are currently compiled on the number of libraries, the amount of their book resources, their finances, and on borrowers as well as home loans.

\footnotetext{
* Based on the data national bibliography as classifield by subject under Finmish literature.

Statistics drawn up on the basis of Unesco recommendations, see Unesco statistical yearbook.
** Fiction includes prose, children's books, juvenile books and poetry.
*** In 1990 information on type of literature was missing for 250 books and 104 small publications. However, they are included in the total, but the percentage share is based on titles for which information on type of literature was available

\section*{8 Newspapers}

Finland has an exceptionally strong newspaper sector: the number of newspaper titles, circulation figures and coverages are all at a very high level. Newspapers and local papers represent approximately 30 per cent of the total turnover of the mass media in Finland and over half of advertising through the mass media.

In 1998 a total of 220 newspapers were published in Finland. Following international practice, Finnish newspapers are classified into two categories, viz. dailies and other newspapers. This distinction is based on the frequency of publication. (Tables 2-4.)

Dailies appearing 4-7 times a week (which are comparatively few in number) have a high average circulation. In 1998, the number of dailies published in Finland was 56 , which had an average circulation of around 42000 copies. Dailies are typically the biggest papers in the region where they are published. Afternoon and evening tabloids are also classified as dailies, as are certain specialized newspapers and some of the smaller newspapers in towns with at least two newspapers.

Other newspapers appear 1-3 times a week. The number of titles published in this category is high, but in terms of circulation they tend to be rather small. In 1998 there were 164 papers in this category, with an average circulation of just over 6000 copies. The biggest single subcategory in this group is represented by so-called local papers, which cover a small circulation area and concentrate on local news. Other papers in this category include some of the "second newspapers", i.e. smaller papers in towns with two newspapers or more, as well as a couple of specialized newspapers.

The relative shares of dailies and other newspapers have remained more or less unchanged since the early 1980s. The number of dailies as a proportion of all newspaper titles has been around one-quarter, but in terms of circulation they very much dominate the field. In 1998, their combined circulation accounted for over two-thirds or 70 per cent of the total newspaper circulation. Dailies appearing seven times a week alone accounted for around half of the total circulation of newspapers.

Another common distinction in the newspaper sector is based on competitive position. An analysis from this vantage-point indicates that there have been two clear changes in the structure of the Finnish press compared with the early 1980s. (Table 5 \& Figure 1.)

Figure 8.1 Circulation of newspapers by type of paper 1997

One of these changes is the decline of the category of 'second' newspapers, where circulations as well as the number of titles have dropped. The biggest single case was the discontinuation in the early 1990s of Uusi Suomi, the Helsinki-based national newspaper with long traditions (est. 1847), which reduced the total circulation of second newspapers by almost one quarter. All in all the circulation share of all second papers has declined to about one-third the level of the early 1980s.

The other significant change has been the marked increase in the market share of afternoon tabloids. The competition between Ilta-Sanomat and Iltalehti (which was launched in 1980) has served to increase the circulations of both papers. Their share of the total newspaper circulation (around \(10 \%\) ) has increased more than 2.5 -fold compared to the situation in the early 1980s. (Table 5.)

Afternoon papers are sold on a single-copy basis. Today over 95 per cent of the single-copy sales of Finnish newspapers consist of the sale of afternoon papers (Table 18). In international comparison single-copy sales of other newspapers (both Finnish and foreign) is at an exceptionally low level in Finland. Indeed subscriptions account for the bulk of total sales of both newspapers and magazines in Finland. Around 90 per cent of all newspapers sold are delivered direct to subscribers (Table 10.)

Newspapers are still the most significant force in the Finnish mass media in terms of economic volume, even though the economic recession that hit the country in the early 1990s significantly reduced their advertising revenue. In 1997 the turnover of Finnish newspapers was approximately FIM 5.6 billion. (Table 1.) Newspapers continue to account for a very large part, about 30 per cent of the media industry's turnover in Finland. During the 1990s this figure has dropped by no more than a couple of percentage points, which is a fairly modest decrease compared to the quite dramatic changes in newspapers' sources of income and circulation numbers. Today advertising accounts for no more than just over half (53\%) of the total revenue of newspapers, while the figure in the late 1980s was still in excess of 70 per cent (including all classified advertisements). During the 1990s the combined circulation of all newspapers has declined by 18 per cent or some 750000 copies from 4.1 million to 3.3 million (Table 3). Discontinued papers account for less than 100000 copies of this figure. In 1997 the decline in the circulation of dailies seemed to bottom out, but continued for newspapers appearing less frequently.

One of the major factors behind the declining circulation numbers was obviously the sharp increase in unemployment levels in the early 1990s, which gave rise to considerable economic hardship. However, part of the explanation lies in the conscious steps taken by the newspapers themselves. For example, in the late 1980s some major regional dailies went out of their way to expand their circulation areas, sparing no expense either in covering a larger news area or in distributing the paper - sometimes in campaigns which did not even cover the costs of distribution. With the onset of recession, these ambitions of expansion had to be put on ice. For some papers then, the decrease in circulation numbers has actually been conducive to a healthier financial structure.

Newspapers continue to command a large share of total media advertising in Finland, even though that share has dropped by around 10 percentage points during the 1990s. Even so newspapers still account for over 50 per cent of total media advertising in Finland, while the average for Western European countries in 1996 was 40 per cent. (Table 4 in Chapter \(1 \&\) Table 2 in Chapter 12.)

The biggest single expense item for dailies in Finland is technical production ( \(31 \%\) ). Editorial work accounts for roughly one-quarter of the expenses. (Table 11.)

As a result of numerous company takeovers and mergers, the market shares of the biggest newspaper companies (measured in terms of circulations) have increased. (Figure 5; Tables \(12 \& 13\).) Since the mid-1980s, for instance, the share of the combined circulation of the four biggest companies has increased from 31 to 48 per cent, that of the eight biggest companies from 43 to 61 per cent. The biggest shifts in these figures have occurred in 1986-1988 and from 1994 onwards. During the latter half of the 1980s some major national dailies (including Uusi Suomi, Ittalehti and Kauppalehti) were taken over by Tampereen Kirjapaino/Aamulehti Group. Today, Aamulehti Group is part of Alma Media, Finland's second biggest
media company after Sanoma - WSOY. During the 1990s Alma Media has gained control of a number of regional newspapers. It also owns an extensive chain of local newspapers. Other significant ownership changes during the 1990s include the expansion of a major regional newspaper chain in south-eastern Finland (Kymen Lehtimedia, which was completely taken over by Sanoma - WSOY in spring 1999) and the formation of another major regional chain in central Finland (Keski-Suomen Media, where Sanoma - WSOY holds 22 per cent of the shares). Sweden's leading newspaper publisher Bonnier is now the biggest shareholder ( \(21 \%\) ) in Alma Media, which was formed in spring 1998 with the merger of Aamulehti Group and the leading commercial television company MTV3 Finland.

The growth of newspaper chains is a trend which may be expected to continue at both the national and Scandinavian level. For instance, Norway's biggest newspaper publisher Schibsted has in recent years acquired significant shareholdings in Swedish papers, and in late 1998 Sanoma-WSOY became a major shareholder ( \(21 \%\) ) in A-pressen, Norway's second-biggest newspaper chain.

There has also been a trend towards closer editorial and marketing cooperation between newspaper companies both within chains and between independent papers. One of the forms of editorial cooperation is the publication of joint TV magazines, Sunday pages and special supplements. Taking a bird's-eye view, this kind of cooperation will probably lead to a further homogenization of the contents of newspapers. However, the net result for readers of papers with limited resources is probably positive: they can look forward to a more varied content in their own newspaper. Indeed it is unlikely that the average reader is overly concerned by the trends of homogenization because there are only relatively few people who read more than one regional paper.

In 1996 editorial material took up about 70 per cent of total registered space in Finnish newspapers; the remaining 30 per cent was taken up by advertising material. The three major categories of editorial material in 1996 were domestic material \((32 \%)\), sport ( \(15 \%\) ) and entertainment ( \(14 \%\) ). (Table 14.)

The number and economic volume of free sheets increased sharply during the early 1980s, but growth slowed down after the mid-1980s. The number of free sheets distributed to households declined very sharply during the recession. In recent years the leading free sheets in towns have been merging into chains, and a completely new phenomenon in Helsinki was the launch in 1997 of a daily free newspaper for commuters and pedestrians, based on the concept of Metro that has been highly successful in the Swedish capital of Stockholm. The leading publisher on the Finnish free sheet market is Janton. The latest comprehensive survey of free sheets was conducted in 1994, when a total of 106 free sheets were published in Finland, with a total print of 3.5 million copies. (Table 21.)

\section*{Statistical sources}

Circulation statistics for newspapersas well as readership figures are based on statistics compiled by the Finnish Audit Bureau of Media.

The Finnish Newspaper Publishers' Association compiles annual statistics on various aspects of its member papers' operations: economy, technology, and editorial issues. The Association publishes annually a special issue of its Suomen Lehdistö journal that contains statistics on the Finnish print press.

The annual statistics compiled by Posts and Telecommunications (as from the beginning of 1994 Finland Post Ltd) contain data on the number of newspapers delivered by the post office. The data on the single-copy sales of Finnish and foreign newspapers are from the Annual Reports of Rautakirja Oy, which dominates the wholesale distribution of single copies of newspapers and magazines in Finland.

The Intermedia surveys published every other year by MDC Media Research Ltd contain information on the reading of newspapers and changes in reading patterns.

\section*{9 Magazines and periodicals}

Measured in terms of sales volume, magazines and periodicals are the sec-ond-biggest mass media in Finland after dailies. In 1997 the turnover of the magazine business was around FIM 3.4 billion, representing 18 per cent of the turnover of all mass media (Table 1). If the 1990s have been a survival story for newspapers, for magazines the past decade has been more of a success story.

The main sources of income for magazines are subscriptions and single-copy sales, but in recent years the role of advertising revenue has been increasing ( Ta ble 5). Indeed magazines and periodicals account for an increasing share of total advertising revenue in the mass media: in 1997 the figure was 15 per cent. In recent years the trends in magazine advertising in Finland have been moving in the opposite direction than in many other European countries. In many countries magazines saw their share of the advertising cake decrease particularly from the mid-1980s up to the mid-1990s. The difference between Finland ( \(15 \%\) in 1997) and the average level in Europe ( \(19 \%\) in 1996) has been reduced to four percentage points from double figures in 1990 (cf. Table 3 in Chapter 12).

Audits indicate that net circulations of magazines have also developed favourably in recent years. A number of new magazines have been launched during the past couple of years, particularly in the special-interest sector. There is a growing trend to test the markets ahead of the actual launch of new magazines by releasing spin-offs, or even to create whole families of magazine titles under more established names.

Four in five consumer magazines in Finland are delivered direct to subscribers (Table 6). Indeed Finland is one of the few European countries where revenues from subscriptions to consumer magazines exceed the revenues from single-copy sales. According to the statistics published in World Magazine Trends 1996, for instance, there were only two other countries with the same situation, namely Holland and Sweden. However, the ratio of subscriptions to single-copy sales is in a league of its own in Finland. This applies to both magazines and newspapers.

There is a large selection of magazines and periodicals in Finland. In 1998, the total number of magazine titles was around 2700 . These magazines are included in the delivery statistics maintained by Finland Post and meet the following criteria:
- they appear regularly at least four times during the calendar year (the traditional definition as specified in the Freedom of the Press Act);
- they contain in each issue several articles or other editorial material;
- anyone can subscribe to these magazines or periodicals, or they are delivered on a membership or customer basis to the receiver's address; and
- the contents do not consist primarily of business announcements, price lists, or advertisements.

Some sources refer to the statistics of the University of Helsinki bibliographical department and on this basis put the total number of magazine titles at around 5000. However, this figure is based on the Unesco classification and includes all periodicals (excluding newspapers) that are published at least twice a year. According to the University of Helsinki free copy register some 3500 of these were published four times a year in 1997 (Table 2).

The discussion that follows is based primarily on the former, quarterly definition, which means it is concerned with some 2700 magazines and periodicals. According to the classification that is now widely in use, magazines and periodicals are divided into the following four groups:
1 Consumer magazines, which are further divided into the subgroups of gen-eral-interest and family magazines, women's magazines, men's magazines, children's magazines and special-interest and hobby magazines ( 316 titles in 1998);

2 Trade and business magazines, which are divided by subject area into a number of groups (2 062 titles);

3 Opinion journals, which are further divided by subject into society and politics, culture, religion and other ideological publications ( 152 titles); and
4 Customer magazines; these are published and paid by large business enterprises, e.g. banks, and delivered to customers or the general public free of charge (208 titles).

Finland Post has used this classification in compiling statistics on the volume of magazines and periodicals it delivers (Tables \(8 \& 9\) ). Adding the number of single copies sold (Table 10) to the category of consumer magazines, the total volume of magazines and periodicals ( \(=\) circulation multiplied by number of issues per year) amounts to around 380 million copies. Divided equally among all households in the country, this translates into 164 issues of magazines or three annual subscriptions to weekly magazines or as many as 14 annual subscriptions to monthly magazines per household.

The breakdown of the annual volume of magazines by category in 1998 was as follows:
- Consumer magazines \(40 \%\)
- Trade \& business magazines \(41 \%\)
- Opinion journals \(3 \%\)
- Customer magazines \(15 \%\)

Figure 9.1 Magazine categories: volume index 1992-1998 (1992=100)

Data on the volume of magazines delivered by Finland Post were classified by type of magazine for the first time in 1992. Circulation data compiled by the Finnish Audit Bureau of Media provide a useful tool for the analysis of longer-term trends in development. However, it is important to note that the number of magazines with audited circulation figures may vary considerably from year to year. Audits are mainly commissioned by papers for which advertising is an important source of revenue, which means that these data only cover a small portion (but certainly an important portion when measured in terms of circulation and readership numbers) of all magazine titles. In 1998, some 250 magazines had valid audit figures.

Single-copy sales of domestic magazines dropped in the early 1980s. Since then there have been no dramatic changes in the numbers of copies sold (Table 10). On the other hand, sales of afternoon tabloids, a major rival for magazines in the sin-gle-copy market, increased very sharply in the 1980s (cf. Table 17 in the Newspapers Chapter). Today, single-copy sales of afternoon tabloids exceed the combined single-copy sales of all magazines more than three times over. This may be regarded as a clear indication of the relative weakness of single-copy sales and the strength of subscriptions in the Finnish magazine market.

Single-copy sales of foreign magazines increased particularly in the mid-1980s, but the trend then came to a standstill. During the early 1990s single-copy sales of foreign magazines declined (Table 10). Sales figures for 1998 ( 3.4 million copies) were down by 0.8 million compared to the peak year of 1991 ( 4.2 million copies).

Most of the single copies of foreign magazines were in the category of spe-cial-interest magazines. General-interest, family and women's titles account for about one-quarter of the sales value of foreign magazines. (Table 12).

There are three magazine publishers in Finland that are clearly bigger than the rest of the field. In the late 1980s the takeover by Yhtyneet Kuvalehdet of Lehtimiehet made Yhtyneet Kuvalehdet by far the biggest company in the business. The company is now owned by Otava, the country's second biggest book publisher. The two other major publishing houses are Helsinki Media Company, which is a part of Sanoma - WSOY Group, and A-lehdet. In 1997 these three biggest publishers together published 71 consumer magazine titles with a combined annual volume of 97 million copies (Table 7.)

Among the biggest magazine companies in Finland there are four (Aller, Forma, Bonnier Julkaisut and Valitut Palat-Reader's Digest) which are in foreign ownership. Semic, now known as Egmont Kustannus, which was under the ownership of Swedish-based Bonnier, the biggest media company in Scandinavia, was sold in 1997 to the Danish company Egmont (50\%) and Helsinki Media Company (50\%). In 1990 foreign-owned publishers accounted for 10 per cent of the production volume of the eight biggest publishers in Finland, in 1997 the share had increased to 17 per cent. This increase can be attributed almost entirely to the continued success in the Finnish marketplace of Denmark's biggest magazine publisher Aller, which started up in Finland in 1992 (Table 7).

Finnish publishing houses have not been very active in terms of foreign expansion, although Helsinki Media has taken some steps to move into the Scandinavian market and Yhtyneet Kuvalehdet into the Baltic region. Helsinki Media publishes three magazines in Sweden. Its biggest project was launched in 1994, a Swedish version of a highly successful Finnish concept (ET-lehti, cf. Figure 2) intended for the 'grey panthers' segment.

In 1997 the eight biggest publishing houses accounted for about 30 per cent of the total volume of Finnish magazines and periodicals and for around 80 per cent of the volume of consumer magazines. These estimates are based on volume data published by Finland Post and Rautakirja Oy.

\section*{Statistical sources}

The net circulations of magazines are audited annually by The Finnish Audit Bureau of Circulations. The same company is behind the National Readership Survey, which measures the readerships of the biggest magazine and newspaper titles. The methods of data collection and estimation were revised at the beginning of 1995, and the results of the latest measurements are therefore not directly comparable with earlier statistics.

The Finnish Periodical Publishers' Association compiles statistics on the activities of its members and publishes annually a media handbook on the Association's magazines and periodicals. The handbook also contains some statistics on Finnish magazines in general.

The bibliographical department of the Helsinki University Library compiles statistics on magazine titles published in Finland. However, the definitions applied for magazines and other periodicals in these statistics are not unambiguous.

The data on the single-copy sales of domestic and foreign magazines come from the Annual Reports and other statistics compiled by Rautakirja Oy, which dominates the distribution of single copies in Finland.

The Intermedia surveys published every other year by MDC Media Research Ltd contain information on the reading of magazines and changes in reading patterns.

Figure 9.4 Single-copy sales of foreign magazines and periodicals by country of origin 1997

\section*{10 Mass media and new communications technology}

Finland is one of the world's leading countries as far as the adoption and use of new communications technology is concerned. For instance, in 1998 it was estimated that Finland together with Iceland had more Internet subscriptions per capita than any other country in the world. Similarly, expenditure on information technology as a proportion of GDP and the number of home computers recently ranked among the highest in the world.

As well as influencing the methods and modes of presenting different contents (e.g. multimedia), new communications technology also has an impact on the technical production and distribution of products and services.

Major structural changes are also taking place at the corporate level. Traditional boundaries between different branches and industries are obscured with the strategic alliances that are being formed at both the national and international level. In Finland, we have recently seen two new major multimedia businesses created through mergers (Sanoma - WSOY and Alma Media). On the international scene, the Swedish-based Marieberg and the German company Bertelsmann are among the new major players that are involved in both the traditional printing industry, electronic communications and in the new media industry.

\section*{Hardware}

In households, the development of new communications technology has had three main effects: 1) the range of programming available has expanded; 2) the ways of using different media have become more and more individualized; and 3) there has been a tendency towards greater interactivity. At least the former two trends were already reinforced by such more 'traditional' forms of home electronics as VCRs and CD-players; and on the other hand by the rapid growth of satellite and cable television.

Figure 1 illustrates how certain kinds of new communications technology have been spreading in Finnish households; some more 'traditional' categories are also included for comparison. Both entertainment electronics and PCs have been spreading in private households more rapidly in other Nordic countries than in Finland. It is not until after the mid-1990s that we have seen the number of PCs, videos and CD-players in households increase more rapidly. The number of

CD-ROMs, modems and Internet connections is also rapidly increasing. In autumn 1998, about one in four households in Finland had a CD-ROM, one in five had an Internet connection.

According to data describing selection into groups using new communications technology, it seems that most people who use home computers nowadays are young men in small households as well as children and young people in family households. However, there are now signs of increasing convergence in this regard.

None of the categories of entertainment electronics mentioned above gets anywhere near the pace at which mobile phones have been spreading in Finnish households. Surveys indicate that within the space of just three years, the penetration of mobile phones in Finnish households has increased from less than 20 to almost 75 per cent. (Figure 1.)

Based on the Universal Mobile Telecommunication Service (UMTS), the next generation of mobile phones will include such features as moving picture and multimedia. The first UMTS networks are due to be introduced in Finland in 2002, and operating licences have now been granted for four nationwide networks. If the pace at which mobile phones penetrated Finnish households is anything to go by, we can expect to see Finland again among the first countries in the world to introduce this technology.

Figure 11.1 Penetration of selected household equipment 1985-1998

Comparative data published by the European Union indicate that Finland ranks clearly above the European average in terms of access to computers or CD-ROM (at home, at place of study or in the workplace). As regards access to modems and the Internet, Finland ranked among the top countries. (Table 2. Cf. also Table 15 in Chapter 12 of this publication.)

\section*{New media industry}

In 1998 the Finnish new media industry had an estimated turnover of FIM 700 milIion (Table 4). For the present purposes the new media industry is defined as comprising companies which operate in content production, technical solutions and related support services for digital media (e.g. multimedia and CD-ROM) and/or information networks (e.g. Internet). In 1999, the mean age of these companies was no more than \(3-4\) of years, yet the total number of companies had climbed to around 330 .

It is quite natural for small companies that often start out on an amateur basis to cluster so that they can be organized for more efficient production. One strategy aimed at greater efficiency is mutual networking and cooperation on a voluntary basis. Another possibility is provided by integration through ownership arrangements such as cross ownership. A third possibility is for large media companies to buy out smaller operators in the media industry. All of these three strategies are in active use.

Buying up a new media company is the easiest way for a traditional operator to expand its area of expertise. One example of a company that has expanded through takeovers is Talentum, who publish business and technology magazines. Talentum now owns Finland's biggest new media company, Interaktiivinen Satama. (Table 5.)

On the other hand, the major media companies are aiming to reorganize their new media operations into smaller independent units. This is the case in Alma Media, for instance.

These changes are all part of a more sweeping process of restructuration in the media field in response to the arrival of digital media. The traditional borderlines between different branches are being eroded. It seems quite likely that we will see these changes continue and indeed accelerate over the next few years.

Finnish new media companies are still comparatively small. In 1998 even the biggest new media company in Finland had a turnover of no more than around FIM 30 million; companies that ranked between second and tenth largest had a turnover in the range of FIM 8-17 million. (Table 5.)

It is important to stress that most companies in the so-called new media industry are not in fact directly involved in what is traditionally defined as mass communication. Much of what they do is best described as organizational or marketing commu-
nication, which in the traditional printing industry is perhaps most closely represented by advertising materials. Other important areas include logistics and customer management systems, banking and investment services as well as web trading solutions. It can be estimated that in 1998 no more than 15-25 per cent, at most, of the total output of the new media industry could be classified as mass communication proper. (Table 6.)

\section*{Information networks}

The Internet has grown very rapidly in popularity during the past few years. At year-end 1998, more than one-quarter ( \(28 \%\) ) of the Finnish population accessed the Internet at least once a week at home, at their place of study or in the workplace. The proportion of daily users was 14 per cent. At the beginning of 1998 it was still somewhat more common for people to get on the Internet at their place of work or study, but by the end of the year use from home was most common. (Table 7.)

Communication over information networks is increasingly being organized along similar lines as are familiar from traditional media such as TV channels: it is packaged and tailored to suit the needs of user groups, even individual users. Indeed there are clear indications that companies operating over the net are interested in forming links and associations with traditional media. On the other hand, the traditional media have also been taking active steps to move into the Internet and many are now leading something of a double life. With the exception of search engines, the most popular WWW sites in Finland are those maintained by traditional media (Table 8).

To an extent surfing the net has now become an everyday activity comparable to television viewing. There is some evidence which suggests that the time people spend on the Internet is time away from the time they spend watching television.

One of the paradoxes of the coexistence of old and new media is that anyone who wants to make known that they have a homepage on the net will usually have to advertise it via traditional print media. Without a campaign in the traditional media, it may be very hard to attract visitors and gain visibility on the net. One estimate says that already in 1997, there were a total of one million homepages on the net, and 1500 new ones were created every day. The competition for attention is fierce indeed. The use of agent technology and webcasting are expected to provide some relief to this problem.

In Finland alone there are on the net around 170 electronic versions of newspapers and magazines. Usually they include only part of the material of the printed paper. On the other hand, some electronic papers have extra material which is not included in the printed version. Most web papers can be accessed free of charge, although some papers want readers to register, which will involve giving some basic
information. This helps to give the publisher some idea of their readership. Some web papers are only accessible to subscribers, which makes the service comparable to printed supplements.

The main strategy adopted by the traditional printing industry in the situation of stiffening competition is to develop new products and services of integrated communication. Faced with the threat of classified advertisements moving from newspapers to information networks, the papers are offering to advertise on the net as a supplementary service. These advertisements provide direct links to the advertiser's server so that readers can make bookings and buy products on the net.

Charging readers for web publications is a major hurdle that is set to cause much trouble. It is not easy to fund the service by means of advertising alone. In the United States some papers such as the Wall Street Journal and the New York Times have started to charge a fee for some of their web pages which used to be free, but this has caused a mass exodus of readers. Even if the charges are small and even if people are in principle willing to pay for a service, this is still a big step: at least so far fee-based web services have not managed to make a real breakthrough.

Advertising in web publications is at least equally problematic. In Finland, data published by Gallup Mainostieto indicate that no more than FIM 22 million was spent on web advertising in 1998, which is less than half a per cent of the total volume of media advertising. A major obstacle to the further growth of advertising is the ambiguity of the concepts of 'circulation' and 'reader'. No one has as yet been able to offer a clear-cut definition for the circulation of a web paper, and consequently methods of measurement vary widely.

The equation then remains unsolved. Nonetheless more and more papers have decided to go into cyberspace and are now developing their own web versions. They are doing so not only in the hope that this can some day become a profitable business, but also because they want to ward off any possible new rivals as early as possible.

The latest trends in the development of television technology are also leading towards integration. Set-top boxes have now been launched in Finland as well, allowing viewers to use the television set to link up with the Internet via remote control the obvious idea being to make the Internet more accessible. The set-top box costs around FIM 2000-2500, which is much less than the price of a PC and modem; on • the other hand, there is also a considerable difference in performance. There is also a monthly fee of FIM 50-100 depending on what kind of package the subscription includes.

Quite extensive tests have been run on the performance of subscription video systems (VOD, Video On Demand) and interactive television services in Finland since 1994. As yet, however, this work has produced no finished products for the mass markets.

\section*{CD-ROM}

In 1997 CD-ROMs still accounted for no more than FIM 200 million or about one per cent of the turnover of the mass media in Finland. During the past couple of years market growth has been clearly slower than expected. As far as CD-ROM games are concerned this is often explained by the revival of television games as well as by pirating. As regards multimedia CD-ROMs, it seems that growth is hampered by two major factors, i.e. pirating and free and ready access to high-quality encyclopaedic material on the Internet.

A good indicator of the penetration of a new product into the mass market is the decision by supermarkets to have it on their shelves. In Finland supermarkets have now been selling CD-ROMs for the past two-three years.

In 1997 multimedia products accounted for 35 per cent of the total CD-ROM market, with games accounting for the remaining 65 per cent (excluding playstation programs). Encyclopedias and reference books are particularly well-suited for use on CD-ROM because of the PC's quick search facility. Indeed the top-selling item in the annual spring sale of a major bookstore chain in 1997 was a reference book in CD-ROM format.

Foreign material accounts for the bulk of CD-ROM sales in Finland. Estimated on the basis of statistics published by the Finnish Book Publishers' Association, domestic material accounts for about one-quarter of total sales. In 1998 sales by the Association's member companies (in wholesale value) were around FIM 30 million (Tables 10 \& 11).

In the category of multimedia products, it is estimated that domestic products account for over half of total sales. Only a few per cent of game products are Finn-ish-made or translated into Finnish.

One of the difficulties with CD-ROM sales is that games in particular are always designed to the performance of the most powerful PCs currently available. It is not uncommon for home users to find that the top-of-the-range CD-ROMs do not run properly on their PCs. This is a vicious circle that may discourage some potential users altogether. It may also go some way towards explaining the strong revival of sales of playstations and console games (Nintendo, Sega, Sony).

The storage capacity of the digital versatile disc or DVD is several times greater than that of the CD-ROM system. DVD will hold a full-length feature film, for instance. Indeed the new system has initially been marketed as a replacement of VCR. However, DVD can be used for the storage of all kinds of digital data. It therefore
has great potential not only in the consumer market but also in professional use and as a replacement of CD-ROM stations.

In Finland it is expected that initially DVD equipment will begin to gain ground in the PC environment. Sales of separate DVD equipment got under way in Finland in 1998, but since the system cannot be used for recording purposes it has not yet emerged as a real alternative to current VCRs - which is how it has been marketed. Also the range of films currently available on DVD was no more than around one hundred at end-1998.

\section*{11 Government subsidies for the mass media}

Government subsidies for the mass media go primarily to three sectors, i.e. newspapers, books and films. Public support to all other sectors is very limited. The support is provided in different forms, including business and project subsidies, arts grants, target scholarships, and artist awards.

Subsidies for newspapers and magazines have been sharply reduced during the 1990s. At the beginning of the decade a total of almost FIM 500 million was paid out in subsidies, in 1998 the figure was down to FIM 79 million (Table 1 and Figure 1). The biggest cutbacks have been made in indirect support for the print press: that was completely discontinued in 1996. Indirect support consisted of reduced postage for newspapers and magazines, for which the Post Office received compensation from the State. In 1990 a total of more than FIM 300 million was spent on this form of subsidy. The sum dropped to less than one-fifth before it was discontinued. Prior to this decision the subsidy was restricted to the delivery of non-profitable papers mainly in rural areas. Two-thirds of the delivery subsidies went to newspapers and local papers, one-third to magazines (Table 2).

Figure 11.1 Government subsidies to the print press 1985-1998

Direct government subsidies to the print press have also steadily decreased during the 1990s. In 1998 a total of FIM 79 million was paid out, approximately half of the figure for the early part of the 1990s. One form of direct support, i.e. subsidies for newspapers within joint delivery schemes, was discontinued in 1996. This subsidy was made available for purposes of covering delivery costs and for the development of joint delivery systems. (Table 1.)

In 1998 there were three different forms of government support for the print press: selective press subsidies granted by the Council of State, press subsidies for political parties and subsidies for culture papers. The Council of State has granted selective press subsidies for purposes of lowering newspapers' transport, delivery and other costs, for development projects and for supporting news agencies. The amount of money paid out in these subsidies has declined during the 1990s; in 1998 the sum was down to FIM 40 million.

Party subsidies are granted to the organs of political parties represented in Parliament and to the County of \(\AA\) land to support information and communication. Amounting to a total of FIM 35 million in 1998, the subsidy is divided among the political parties on the basis of their relative strength in Parliament.

There used to be a separate support mechanism for religious papers and opinion journals, but in 1994 these subsidies were combined into a subsidy for culture papers. In value terms this is the smallest type of subsidy granted to the print press, but on the other hand it is the only form of support that has increased during the past ten years. In 1998 a total of FIM 4.5 million was paid out in support for culture papers (Table 1.)

Government literature subsidies consist for the main part of different kinds of grants awarded to writers. Subsidies are also paid out to publishers, to organizations active in the literature field and for the promotion of literature in general. (Table 3.)

In 1997 a total of FIM 23 million was paid out in authors' subsidies, half of which consisted of authors' library fees and the other half of various arts grants and project grants. The authors' library fee system can be described as royalties paid by the government to authors whose works are available in public libraries. The library fees are not, however, tied to the number of titles available in library collections or to how many times titles have been borrowed. Each year 10 per cent of the money reserved for libraries' new acquisitions are allocated in the State Budget to this purpose. (Table 3.)

Other forms of literature subsidies are considerably smaller than authors' grants. For example, subsidies for the publication and distribution of books amounted to no more than FIM 3.4 million in 1997. (Table 3.)

The bulk of government subsidies to public libraries can be seen as support for book distribution, although the continuing diversification of library services means that videos and phonograms are now also getting more support. The annual amount of government subsidies to public libraries totals around FIM 500 million, of which
some 90 per cent goes towards overheads and the rest towards initial outlays. The sums have been declining since the peak year of 1992, when government library subsidies amounted to FIM 782 million. (Table 4.)

State subsidies for films include subsidies granted mainly to companies for film production, distribution and presentation, as well as arts grants to individual professionals engaged in film-making. Part of the subsidies go to the promotion of film culture and organizations active in this field.

Subsidies for film production and distribution as well as subsidies for cinemas are channelled mainly through the Finnish Film Foundation. In addition, film production companies may receive quality support which is distributed by the National Council for Cinema to domestic films. In 1997, the amount of subsidies and grants distributed by the Finnish Film Foundation totalled FIM 53 million, of which 45 million was for production. Government subsidies to the Finnish Film Foundation were cut quite drastically in the early 1990s, but the situation has been improving during the past few years. Annual subsidies for film production were increased by a total of FIM 9 million in the State Budgets for 1997 and 1998. There are also plans to channel a further FIM 12 million from TV licence revenues into audiovisual production, including film production. (Table 6 and Figure 2.)

The organization of the Finnish Film Foundation was overhauled in 1996 in connection with administrative rearrangements and changes in subsidy allocation procedures. The Foundation's Administrative Council was abolished and ultimate authority transferred to the Board of Directors. The committee of film industry ex-

Figure 11.2. Grants and subsidies from the Finnish Film Foundation 1988-1997

perts that was responsible for the allocation of production subsidies was also abolished; this task is now the responsibility of the Foundation's Production Manager. At the same time it was decided that the Foundation' Managing Director shall no longer be allowed to hand out monies, although all funding decisions still have to be endorsed by the Managing Director. No major changes were made to the different types and forms of production subsidy.

Government subsidies to artists in the film industry are at a markedly lower level than the production and other subsidies allocated through the Finnish Film Foundation. Having said that, the majority of the subsidies allocated by the Finnish Film Foundation is targeted to professionals in the form of job opportunities. The forms of subsidies allocated to artists in the film industry are the same as in other fields: mainly arts grants of various duration, project grants and prizes. Government arts grants for artists in the film industry amount to a few million marks per annum. (Table 5.)

Support for the Finnish film industry is also channelled through international film funds in which Finland is involved. The most important of these funds are the Nordic Film and TV Fund, the Council of Europe Eurimages Fund and the European Union's Media II Programme.

In 1997 the Nordic Film and TV Fund granted a total of around FIM 4.5 million for the production of Finnish long and short films. In the same year, support from Eurimages amounted to about FIM 1.8 million. This is the sum total allocated to Finnish films: part of the money goes to foreign companies involved in co-productions. In 1997 a total of FIM 4.8 million was received through the Media II Programme for the development, distribution and marketing of Finnish films.

\section*{Collective copyright and royalties}

In the 1970s and 1980s there was a growing movement towards collective copyright and royalty arrangements, which increasingly came to resemble public support mechanisms in terms of their administration and distribution. However, collective royalties are in essence compensations paid out to individual authors etc. rather than public subsidies.

One of the most important sources of collective royalties is the cassette fee, which is added to the price of blank audio cassettes and discs as well as blank video cassettes. The fee for blank audio cassettes, MiniDiscs and CDs that can be recorded an unlimited number of times is \(3 \mathrm{p} / \mathrm{min}^{1}\). The fee for CDs that can only be

\footnotetext{
' 1 FIM \(=100\) penni \((p)\)
}
recorded once is \(1.5 \mathrm{p} / \mathrm{min}\) and for videos \(4.5 \mathrm{p} / \mathrm{min}\). The fee for com-puter-recordable CDs is \(0.3 \mathrm{p} / \mathrm{min}\).
In 1997 net revenues from the cassette fee totalled FIM 54 million (Table 7). The revenues declined during the early 1990s following on a decision to reduce the per minute fee, various evasion strategies and the economic recession, but in recent years they have been increasing again.
The proceeds of the cassette royalty fee are divided according to instructions revised annually by the Ministry of Education. One-third of the money is channelled directly to the copyright holders, the remaining two-thirds is allocated through copyright organizations for purposes of promoting films, videos, phonograms, music, literature and arts. (Table 8.)

A major source of support for video production and distribution has been the Promotion Centre for Audiovisual Culture in Finland (AVEK), whose grants are largely funded by cassette fees. Part of the Film Foundation grants for video production also come from the same source. Subsidies for phonogram production granted by the Finnish Performing Music Promotion Centre (ESEK) are also partly funded through cassette royalty fees (Tables 9 and 10).

Compensation for photocopying is another form of royalty linked with mass communication. The revenue from these compensations is distributed via the member organizations of Kopiosto, a joint organization for the administration of copyrights. In 1997 a total of around FIM 25 million was collected from administration, schools, enterprises and other organizations as compensations for photocopying. (Tables 11 and 12.)

\section*{Statistical sources}

Appropriations for public support of the mass media are listed in the State Budget as well as in the national accounts (under various sub-items of the Ministry of Education and Ministry of Transport and Communications main divisions).

Information on the use of appropriations for culture and communication within the jurisdiction of the Ministry of Education is published in the annual reports of the Central Arts Council and the Council's journal Arsis.
The Finnish Film Foundation gives details on the breakdown of film subsidies to different projects in its annual reports.

Data on the use of cassette royalty fees and photocopy compensations are available in the annual decisions issued by the Ministry of Education as well as in the annual reports of copyright societies.

\section*{12 International comparisons}

This chapter provides selected comparative data on the role and function of the mass media in different countries. It is important to bear in mind that in spite of efforts at standardization, statistical standards and criteria may still vary in different countries; the data are not always fully comparable. For instance, data on the number of satellite connections are available from many different sources. The data provided by different sources may vary considerably and must therefore be examined with special caution. Valuable work for improving the comparability of the statistics on audiovisual mass communication has in recent years been done most particularly by the European Audiovisual Observatory and Eurostat, the Statistical Office of the European Communities.

The different criteria of calculation applied in various comparisons may also yield very different results. For instance, the 1995 edition of the TBI Yearbook had three different lists of the biggest media companies, using different sets of criteria in each to rank-order them.

Unesco's Statistical Yearbook is a massive and important source, although it includes only fairly limited comparative data on mass media. The annual statistics of the European Audiovisual Observatory (published since 1994) includes an abundance of information on the finances, structure, reach, usage and advertising of audiovisual mass media.

The annual statistics of the World Association of Newspapers (WAN), the World Press Trends, is the most important international statistical publication in the field. For the part of magazines, the gap of information is partly filled by the World Magazine Trends which is produced by Zenith Media in cooperation with the International Federation of the Periodical Press FIPP.

Nordic Media Trends, published by Nordicom (1995- ), is a useful annual source on mass media in the Nordic countries. The latest issue, Nordic Baltic Media Statistics 1998, also covers the Baltic states.

1 Bonniers' media volume. 'Media volume' represents \(92 \%\) of the group's total volume. A fusion of Bonnierföretagen AB and Tidnings AB Marieberg took place in 1998.
2 Pro forma turnover 1997. A fusion of Sanoma, Helsinki Media, and WSOY took place in May 1999.
Rautakirja Oy, a major distributor of periodicals and books and owner of Finland's largest cinema chain, is included as a subsidiary.
3 Pro forma turnover 1997. A fusion of Aamulehti and MTV to form Alma Media took place in April 1998.
4 In addition to Modern Times Group, media interests of Kinnevik (N1000 and Airtime) and Netcom (Kabelvision) are included. All companies are controlled by Jan Stenbeck.

Finnish Mass Media 1999 provides a comprehensive statistical overview of the media scene in Finland. The report is organised into chapters on mass media economy and consumption; television; radio; phonograms; video; films; books and libraries; newspapers and magazines; and government subsidies for the mass media. There is also a separate chapter with international comparative data. Summary articles on each mass media sector complement the statistical overviews.```

[^0]:    Source: Taloustutkimus, Web Traffic Monitor, September 1998

[^1]:    * These data are net of discounts. Figures include planning and production costs.

    Net figures for 1980-1987 have been adapted to comply with the new calculation method used since 1988.
    ** Dailies, non-dailies, and free sheets.
    *** Cable television included since 1984.
    Source: MOC Helsinki Group

[^2]:    Sources: See Tables 2.13, 4.4, 6.1 and 7.3 in this volume.

[^3]:    Source: Yearbooks of industrial statistics. Statistics finland

[^4]:    * Staff in companies with more than five employees. Includes regular part-time workers.

    Source: Yearbooks of industrial statistics. Statistics Finland.

[^5]:    * Includes the manufacture of radio and television transmitters, radar equipment, microphones, loudspeakers and telephones.
    ** Includes the manufacture of radios, televisions, VCRs, cassette recorders, sound recordings as well as blank cassettes.
    NB: Figures for 1995 and onwards are not wholly comparable with the figures untill 1994.
